About this Guide

This guide contains information about configuring and using Kaspersky Security for Windows Server.

This guide will also help you to learn about sources of information about the application and ways to receive technical support.

In this chapter

In this document ............................................................................................................................................. 13
Document conventions ..................................................................................................................................... 15

In this document

The Administrator's Guide for Kaspersky Security for Windows Server contains the following sections:

Sources of information about Kaspersky Security for Windows Server
This section lists the sources of information about the application.

You can select the most suitable information source, depending on the importance level and urgency of the issue.

Kaspersky Security for Windows Server
This section describes the functions, components, and distribution kit of Kaspersky Security for Windows Server, and provides a list of hardware and software requirements of Kaspersky Security for Windows Server.

Installing and removing the application
This section provides step-by-step instructions for installing and removing Kaspersky Security for Windows Server.

Application interface
This section contains information about elements of the Kaspersky Security for Windows Server interface.

Application licensing
This section provides information about the main concepts related to licensing of the application.

Working with the Administration Plug-in
This section provides information about the Kaspersky Security for Windows Server Administration Plug-in and describes how to manage the application installed on a protected server or on a group of servers.

Working with the Application Console
This section provides information about the Kaspersky Security for Windows Server Console and describes how to manage the application using the Application Console installed on the protected server or another computer.
Starting and stopping Kaspersky Security for Windows Server
This section contains information about starting Application Console, and also about starting and stopping Kaspersky Security Service.

Managing access permissions for Kaspersky Security for Windows Server functions
This section contains information about permissions to manage Kaspersky Security for Windows Server and Windows® services registered by the application, and instructions on how to configure these permissions.

Real-Time File Protection
This section contains information about the Real-Time File Protection task and how to configure it.

Script Monitoring
This section contains information about the Script Monitoring task and how to configure it.

KSN Usage
This section contains information about the KSN Usage task and how to configure it.

Traffic Security
This section contains information about the Traffic Security task and how to configure it.

Anti-Cryptor
This section contains information about the Anti-Cryptor task and how to configure it.

Applications Launch Control
This section contains information about the Applications Launch Control task and how to configure it.

Device Control
This section contains information about the Device Control task, as well as instruction to configure the task settings.

Firewall Management
This section contains information about the Firewall Management task and how to configure it.

File Integrity Monitor
This section contains information about starting and configuring the File Integrity Monitor task.

Log Inspection
This section contains information about the Log Inspection task and task settings.

On-Demand Scan
This section provides information about On-Demand Scan tasks, and instructions on configuring On-Demand Scan task settings and security settings on the protected server.

Trusted Zone
This section provides information about the Trusted Zone of Kaspersky Security for Windows Server, as well as instructions on how to add objects to the Trusted Zone when executing the tasks.

Exploit Prevention
This section contains instructions on how to configure process memory protection settings.
Hierarchical storage management
This section provides information about how to perform anti-virus scans of files located in hierarchical storage areas and backup systems.

Integrating with third-party systems
This section describes integration of Kaspersky Security for Windows Server with third-party features and technologies.

Working with Kaspersky Security for Windows Server from the command line
This section describes working with Kaspersky Security for Windows Server from the command line.

Contacting Technical Support
This section describes the ways to receive technical support and the conditions on which it is available.

Glossary
This section contains a list of terms, which are mentioned in the document, as well as their respective definitions.

AO Kaspersky Lab
This section provides information about AO Kaspersky Lab.

Information about third-party code
This section contains information about the third-party code used in the application.

Trademark notices
This section lists trademarks reserved to third-party owners and mentioned in the document.

Index
This section allows you to quickly find required information through the document.

Document conventions
This document uses the following conventions (see table below).

<table>
<thead>
<tr>
<th>Sample text</th>
<th>Description of document convention</th>
</tr>
</thead>
<tbody>
<tr>
<td>Note that...</td>
<td>Warnings are highlighted in red and set off in a box. Warnings contain information about actions that may have undesirable consequences.</td>
</tr>
<tr>
<td>We recommend that you use...</td>
<td>Notes are set off in a box. Notes contain supplementary and reference information.</td>
</tr>
<tr>
<td>Sample text</td>
<td>Description of document convention</td>
</tr>
<tr>
<td>-------------</td>
<td>-----------------------------------</td>
</tr>
<tr>
<td>Example:</td>
<td>Examples are given in blocks against a blue background under the heading &quot;Example&quot;.</td>
</tr>
</tbody>
</table>
| _Update means..._  
The _Databases are out of date_ event occurs. | The following elements are _italicized_ in the text:  
- New terms  
- Names of application statuses and events |
| Press **ENTER**.  
Press **ALT+F4**. | Names of keyboard keys appear in **bold** and are capitalized.  
Names of keys that are connected by a + (plus) sign indicate the use of a key combination. These keys must be pressed simultaneously. |
| Click the **Enable** button. | Names of application interface elements, such as text boxes, menu items, and buttons, are set off in **bold**. |
| ► _To configure a task schedule:_ | Introductory phrases of instructions are italicized and accompanied by an arrow symbol. |
| In the command line, type _help_  
The following message then appears:  
Specify the date in _dd:mm:yy_ format. | The following types of text content are set off with a special font:  
- Text in the command line  
- Text of messages displayed on the screen by the application  
- Data that must be entered from the keyboard |
| <User name> | Variables are enclosed in angle brackets. Instead of the variable name, the corresponding value should be inserted, omitting the angle brackets. |
Sources of information about Kaspersky Security for Windows Server

This section lists the sources of information about the application.
You can select the most suitable information source, depending on the importance level and urgency of the issue.

In this chapter

Sources for independent retrieval of information ................................................................. 17
Discussing Kaspersky Lab applications in the community ................................................... 18

Sources for independent retrieval of information

You can use the following sources to find information about Kaspersky Security for Windows Server:

- Manuals.

If you did not find a solution to your problem, contact Kaspersky Lab Technical Support
https://support.kaspersky.com/.

An Internet connection is required to use online information sources.

Kaspersky Security for Windows Server page on the Kaspersky Lab website

The Kaspersky Security for Windows Server page contains a link to eStore. There you can purchase the application or renew your license.
**Kaspersky Security for Windows Server page in Knowledge Base**

Knowledge Base is a section on the Technical Support website.

The Kaspersky Security for Windows Server page in the Knowledge Base https://support.kaspersky.com/ksws10/ features articles that provide useful information, recommendations, and answers to frequently asked questions about how to purchase, install, and use the application.

Knowledge Base articles can answer questions relating to not only Kaspersky Security for Windows Server but also to other Kaspersky Lab applications. Knowledge Base articles can also include Technical Support news.

**Kaspersky Security for Windows Server documentation**

**Discussing Kaspersky Lab applications in the community**

If your question does not require an immediate answer, you can discuss it with Kaspersky Lab experts and other users in our community https://community.kaspersky.com/.

In this community, you can view existing topics, leave your comments, and create new discussion topics.
Kaspersky Security for Windows Server

This section describes the functions, components, and distribution kit of Kaspersky Security for Windows Server, and provides a list of hardware and software requirements of Kaspersky Security for Windows Server.

About Kaspersky Security for Windows Server

Kaspersky Security for Windows Server protects servers running on Microsoft® Windows operating systems and network attached storages against viruses and other computer security threats to which servers and network attached storages are exposed through file exchange. Kaspersky Security for Windows Server is designed for use on local area networks of medium to large organizations. Kaspersky Security for Windows Server users are corporate network administrators and specialists responsible for anti-virus protection of the corporate network.

You can install Kaspersky Security for Windows Server on servers with the following roles:

- Active Directory® Certificate Services
- Active Directory Domain Services
- Active Directory Federation Services
- Active Directory Lightweight Directory Services
- Active Directory Rights Management Services
- Device Health Attestation
- DHCP Server
- DNS Server
- Fax Server
- File and Storage Services
- Host Guardian Services
- Hyper-V®
- Network Controller
- Network Policy and Access Services
- Print and Document Services
- Remote Access
- Remote Desktop Services
- Volume Activation Services
- Web Server (IIS)
- Windows Deployment Services
- Windows Server® Update Services

Kaspersky Security for Windows Server can be managed in the following ways:

- Via the Application Console installed on the same server as Kaspersky Security for Windows Server or on a different computer.
- Using commands in the command line.
- Via Kaspersky Security Center Administration Console.

The Kaspersky Security Center application can also be used for centralized administration of multiple servers running Kaspersky Security for Windows Server.

It is possible to review Kaspersky Security for Windows Server performance counters for the "System Monitor" application, as well as SNMP counters and traps.

**Kaspersky Security for Windows Server components and functions**

The application includes the following components:

- **Real-Time File Protection.** Kaspersky Security for Windows Server scans objects when they are accessed. Kaspersky Security for Windows Server scans the following objects:
  - Files
  - Alternate file system streams (NTFS streams)
  - Master boot record and boot sectors on local hard and removable drives

- **On-Demand Scan.** Kaspersky Security for Windows Server runs a single scan of the specified area for viruses and other computer security threats. Application scans files, RAM, and startup objects on a protected server.

- **RPC Network Storage Protection and ICAP Network Storage Protection.** Kaspersky Security for Windows Server installed on a server under a Microsoft Windows operating system protects network attached storages against viruses and other security threats that infiltrate the server through exchange of files.

- **Applications Launch Control.** The component tracks users’ attempts to launch applications and controls applications launches.

- **Device Control.** The component controls registration and usage of mass storage devices and CD/DVD drives in order to protect the computer against security threats that may arise while exchanging files with USB-connected flash drives or other types of external device.

- **Anti-Cryptor and Anti-Cryptor for NetApp.** The components protect shared folders on servers and network attached storages from malicious encryption, by blocking the hosts that show malicious activity.
• **Script Monitoring.** This component controls the execution of scripts created using Microsoft Windows Script Technologies.

• **Traffic Security.** This component intercepts and scans objects transferred through web traffic (including mail) to detect known computer and other threats on the protected server.

• **Firewall Management.** This component provides the ability to manage the Windows Firewall: configure settings and operating system firewall rules and block any possibility of external firewall configuration.

• **File Integrity Monitor.** Kaspersky Security for Windows Server detects changes in files within the monitoring scopes specified in the task settings. These changes may indicate a security breach on the protected server.

• **Log Inspection.** This component monitors the integrity of the protected environment based on the results of an inspection of Windows event logs.

The following functions are implemented in the application:

• **Database Update and Software Modules Update.** Kaspersky Security for Windows Server downloads updates of application databases and modules from FTP or HTTP update servers of Kaspersky Lab, Kaspersky Security Center Administration Server, or other update sources.

• **Quarantine.** Kaspersky Security for Windows Server quarantines probably infected objects by moving such objects from their original location to Quarantine folder. For security purposes, objects are stored in Quarantine folder in encrypted form.

• **Backup.** Kaspersky Security for Windows Server stores encrypted copies of objects classified as Infected or Probably infected in Backup before disinfecting or deleting them.

• **Administrator and user notifications.** You can configure the application to notify the administrator and users who access the protected server about events in Kaspersky Security for Windows Server operation and the status of Anti-Virus protection on the server.

• **Importing and exporting settings.** You can export Kaspersky Security for Windows Server settings to an XML configuration file and import settings into Kaspersky Security for Windows Server from the configuration file. You can save all application settings or only settings for individual components to a configuration file.

• **Applying templates.** You can manually configure a node’s security settings in the tree or in a list of the computer file resources, and save the configured setting values as a template. This template can then be used to configure the security settings of other nodes in Kaspersky Security for Windows Server protection and scan tasks.

• **Managing access permissions for Kaspersky Security for Windows Server functions.** You can configure the rights to manage Kaspersky Security for Windows Server and the Windows services registered by the application, for users and groups of users.

• **Writing events to the application event log.** Kaspersky Security for Windows Server logs information about software component settings, the current status of tasks, events that occur while tasks run, events associated with Kaspersky Security for Windows Server management, and information required to diagnose errors in Kaspersky Security for Windows Server.

• **Hierarchical storage.** Kaspersky Security for Windows Server can operate in hierarchical storage management mode (HSM systems). HSM systems allow data relocation between fast local drives and slow long-term data storage devices.

• **Trusted Zone.** You can generate the list of exclusions from the protection or scan scope, that Kaspersky Security for Windows Server will apply in the on-demand and real-time protection tasks.
- **Exploit Prevention.** You can protect process memory from exploits using an Agent injected into the process.
- **Blocked Hosts storage.** You can block remote hosts that try to access the server's shared folders if any malicious activity is detected on their side.

### What's new

Kaspersky Security for Windows Server offers the following new features and improvements:

- Support for new versions of Microsoft Windows operating systems.
  - Windows Storage Server 2019 (x64)
  - Windows Server 2019 (x64)
- Complete activation code cannot be viewed in the application GUI.
  The already added activation code is partially hidden while displayed in the application GUI and cannot be viewed in full by any user.
- Less false positives in Anti-Cryptor task.
  Added default exclusions for several file types to prevent definite false positives.

### Distribution kit

The distribution kit includes the welcome application that lets you do the following:

- Start the Kaspersky Security for Windows Server Installation Wizard.
- Start the Kaspersky Security for Windows Server Console Installation Wizard.
- Start the Installation Wizard that will install Kaspersky Security for Windows Server Administration Plug-in for managing the application via the Kaspersky Security Center.
- Start the Kaspersky Security for Windows Server 10.1 Microsoft Outlook® Add-in (hereinafter referred to as Microsoft Outlook Add-in) Installation Wizard.
- Read the Administrator’s Guide.
- Read the Implementation Guide for Network Attached Storage Protection.
- Visit the Technical Support website [https://support.kaspersky.com/](https://support.kaspersky.com/).
- Read information about the current version of Kaspersky Security for Windows Server.

The `client` folder contains files for the installation of Application Console ("Kaspersky Security for Windows Server Administration Tools" set of components) and a file with the text of the End User License Agreement.
The `server` folder contains:

- Files for the installation of Kaspersky Security for Windows Server components on a computer running a 32-bit or 64-bit Microsoft Windows operating system.
- Archive of anti-virus databases current at the time the application was released.
- File with the text of the End User License Agreement and Privacy Policy.

The `setup` folder contains greeting program start files.

The `email_plugin` folder contains the Microsoft Outlook Add-in installation package and a file with the text of the End User License Agreement.

The distribution kit files are stored in different folders depending on their intended use (see table below).

**Table 2. Kaspersky Security for Windows Server distribution kit files**

</tr>
</tbody>
</table>

Distribution kit files can be run from the Installation CD. If you have copied the distribution package files onto the local drive beforehand, make sure that the structure of the distribution kit files has been preserved.

**Hardware and software requirements**

This section describes all hardware and software requirements for the protected server and network attached storages.

**In this section**

- Requirements for the server on which Kaspersky Security for Windows Server is deployed ........................................ 25
- Requirements for the protected network attached storage ........................................................................................................ 27
- Requirements for the computer on which the Application Console is installed .............................................................................. 28
Requirements for the server on which Kaspersky Security for Windows Server is deployed

Before installing Kaspersky Security for Windows Server, you must uninstall other anti-virus applications from the server.

Hardware requirements for the server

General requirements:

- x86/64-compatible single-core or multi-core systems
- disk space requirements:
  - for installing all application components: 100 MB
  - for downloading and storing anti-virus databases of the application: 2 GB (recommended)
  - for storing objects in Quarantine and in Backup: 400 MB (recommended)
  - for storing logs: 1 GB (recommended)

Minimum configuration:

- Processor: 1.4 GHz single-core
- RAM: 1 GB
- Drive subsystem: 4 GB of free space

Recommended configuration:

- Processor: 2.4 GHz quad-core
- RAM: 2 GB
- Drive subsystem: 4 GB of free space

Software requirements for the server

You can install Kaspersky Security for Windows Server on a server under a 32-bit or 64-bit Microsoft Windows operating system.

For installation and operation of Kaspersky Security for Windows Server, Microsoft Windows Installer 3.1 must be installed on the server.

You can install Kaspersky Security for Windows Server on a server under one of the following 32-bit Microsoft Windows operating systems:

- Windows Server 2003 Standard / Enterprise / Datacenter SP2 or later
- Windows Server 2003 R2 Foundation / Standard / Enterprise / Datacenter SP2 or later
You can install Kaspersky Security for Windows Server on a server under one of the following 64-bit Microsoft Windows operating systems:

- Windows Server 2003 Standard / Enterprise / Datacenter SP2 or later
- Windows Server 2003 R2 Standard / Enterprise / Datacenter SP2 or later
- Windows Server 2008 Core Standard / Enterprise / Datacenter SP1 or later
- Windows Server 2008 Standard / Premium SP1 or later
- Microsoft Small Business Server 2008 Standard / Premium
- Windows Server 2008 R2 Foundation / Standard / Enterprise / Datacenter SP1 or later
- Windows Server 2008 Core R2 Standard / Enterprise / Datacenter SP1 or later
- Windows Hyper-V Server 2008 R2 SP1 or later
- Microsoft Small Business Server 2011 Essentials / Standard
- Microsoft Windows MultiPoint™ Server 2011 Standard / Premium
- Windows Server 2012 Core Foundation / Essentials / Standard / Datacenter
- Microsoft Windows MultiPoint™ Server 2012 Standard / Premium
- Windows Storage Server 2012
- Windows Hyper-V Server 2012
- Windows Server 2012 R2 Foundation / Essentials / Standard / Datacenter
- Windows Server 2012 Core R2 Foundation / Essentials / Standard / Datacenter
- Windows Storage Server 2012 R2
- Windows Hyper-V Server 2012 R2
- Windows Server 2016 Essentials / Standard / Datacenter
- Windows Server 2016 MultiPoint
- Windows Server 2016 Core Standard / Datacenter
- Microsoft Windows MultiPoint™ Server 2016
- Windows Storage Server 2016
- Windows Hyper-V Server 2016
- Windows Server 2019 Core
- Windows Storage Server 2019
- Windows Hyper-V Server 2019
The following operating systems are no longer supported by Microsoft Windows: Windows Server 2003 Standard / Enterprise / Datacenter SP, Windows Server 2003 R2 Standard / Enterprise / Datacenter SP2 32-bit, 64-bit. There might be limitations for the technical support of servers running these operating systems on the Kaspersky Lab side.

You can install Kaspersky Security for Windows Server on the following terminal servers:

- Microsoft Remote Desktop Services based on Windows Server 2008
- Microsoft Remote Desktop Services based on Windows Server 2008 R2
- Microsoft Remote Desktop Services based on Windows Server 2012
- Microsoft Remote Desktop Services based on Windows Server 2012 R2
- Microsoft Remote Desktop Services based on Windows Server 2016
- Microsoft Remote Desktop Services based on Windows Server 2019
- Citrix XenApp 6.0, 6.5, 7.0, 7.5 - 7.9, 7.15
- Citrix XenDesktop 7.0, 7.1, 7.5 - 7.9, 7.15

The Kaspersky Security for Windows Server is compatible with the following versions of Kaspersky Security Center:

- Kaspersky Security Center 10.4
- Kaspersky Security Center 10.5
- Kaspersky Security Center 11

**Requirements for the protected network attached storage**

Kaspersky Security for Windows Server can be used to protect the following network attached storages:

- NetApp with one of the following operating systems:
  - Data ONTAP 7.x and Data ONTAP 8.x in 7-mode
  - Data ONTAP 8.2.1 in cluster-mode
  - Data ONTAP 9.0 in cluster-mode
  - Data ONTAP 9.1 in cluster-mode
  - Data ONTAP 9.2 in cluster-mode
  - Data ONTAP 9.3 in cluster-mode
  - Data ONTAP 9.4 in cluster-mode
- Dell™ EMC™ Celerra™ / VNX™ with the following software:
  - EMC DART 6.0.36 or higher
  - Celerra Antivirus Agent (CAVA) 4.5.2.3 or higher
- Dell EMC Isilon™ with the operating system OneFS™ 7.0 or later
- Hitachi HNAS (ICAP, RPC):
- 12.0 or later for integration via ICAP
- 11.2 or later for integration via RPC
- IBM System Storage N series
- Oracle® ZFS Storage Appliance
- Dell NAS on the platform Dell Compellent™ FS8600:
  - FluidFS 6.x
  - FluidFS 5.x
- HPE 3PAR with File Persona 3.3.1:
  - HPE 3PAR STORESERV File Controller
  - HPE 3PAR STORESERV 7000c, 8000, 9000, 20000 Storage

Requirements for the computer on which the Application Console is installed

**Hardware requirements for the computer**
Recommended RAM amount: at least 128 MB.
Free disk space: 30 MB.

**Software requirements for the computer**
You can install the Application Console on a computer running a 32-bit or 64-bit Microsoft Windows operating system.

The computer should have Microsoft Windows Installer 3.1 in order to support installation and operation of the Application Console.

You can install the Application Console on a computer running one of the following 32-bit Microsoft Windows operating systems:
- Windows Server 2003 Standard / Enterprise / Datacenter SP2 or later
- Windows Server 2003 R2 Standard / Enterprise / Datacenter SP2 or later
- Windows Server 2008 Standard / Enterprise / Datacenter SP1 or later
- Microsoft Windows XP Professional SP2 or later
- Microsoft Windows Vista®
- Microsoft Windows 7
- Microsoft Windows 8
- Microsoft Windows 8.1
- Microsoft Windows 10
- Windows 10 Redstone 1
- Windows 10 Redstone 2
- Windows 10 Redstone 3
You can install the Application Console on a computer running one of the following 64-bit Microsoft Windows operating systems:

- Windows Server 2003 Standard / Enterprise / Datacenter SP2 or later
- Windows Server 2003 R2 Standard / Enterprise / Datacenter SP2 or later
- Windows Server 2008 Core / Standard / Enterprise / Datacenter SP1 or later
- Microsoft Small Business Server 2008 Standard / Premium
- Windows Server 2008 R2 Foundation / Standard / Enterprise / Datacenter SP1 or later
- Windows Hyper-V Server 2008 R2 SP1 or later
- Microsoft Small Business Server 2011 Essentials / Standard
- Microsoft Windows MultiPoint Server 2011 Standard / Premium
- Microsoft Windows MultiPoint Server 2012 Standard / Premium
- Windows Server 2012 R2 Foundation / Essentials / Standard / Datacenter
- Windows Storage Server 2012 R2
- Windows Hyper-V Server 2012
- Windows Hyper-V Server 2012 R2
- Windows Server 2016 Essentials / Standard / Datacenter
- Microsoft Windows MultiPoint Server 2016
- Windows Storage Server 2016 Essentials / Standard / Datacenter
- Windows Storage Server 2019
- Microsoft Windows XP Professional Edition SP2 or later
- Microsoft Windows Vista
- Microsoft Windows 7
- Microsoft Windows 8
- Microsoft Windows 8.1
- Microsoft Windows 10
- Windows 10 Redstone 1
- Windows 10 Redstone 2
- Windows 10 Redstone 3
- Windows 10 Redstone 4
• Windows 10 Redstone 5
• Windows 10 Redstone 6

Functional requirements and limitations

This section describes additional functional requirements and existing limitations for Kaspersky Security for Windows Server components.

In this section

<td>33</td>
</tr>
</tbody>
</table>

Installation and uninstallation

- During application installation a warning appears, if a new path to the Kaspersky Security for Windows Server installation folder contains more than 150 symbols. The warning does not affect the installation process: Kaspersky Security for Windows Server will install and run successfully.
- For installation of the SNMP protocol support component the SNMP service must be restarted, if it is running.
- For installation and functioning of Kaspersky Security for Windows Server on the device managed by the embedded operating system, the Filter Manager component must be installed.
- The Kaspersky Security for Windows Server Administration Tools installation is not available via the Microsoft Active Directory group policies.
- When installing application on computers running on the older operating systems, which cannot receive regular updates, it is required to check the following root certificates: DigiCert Assured ID Root CA, DigiCert_High_Assurance_EV_Root_CA, DigiCert AssuredID Root CA. Lack of specified certificates can lead to incorrect application functioning. It is recommended to install specified certificates in any possible way.

Traffic Security

- The component is available only on the servers running on operating systems higher than Microsoft Windows Server 2008 R2.
- Traffic cannot be verified when web connections are made using a cryptographic token.
- It is not recommended to include the VPN traffic in the protection scope (port 1723).
- Working with IP addresses in IPv6 format is not available.
• Application considers self-signed certificates as invalid and blocks such connections if the **Do not trust web-servers with invalid certificate** check box is selected in the task settings.

• Application processes only TCP packets.

• Mail threat protection does not scan outgoing mail traffic.

• It is recommended to install the Administration Plug-in before deploying Traffic Security component, as the Network Agent of the Administration Server detects the Traffic Security component when connecting to the application. If Traffic Security was installed and the task started before the installation of Administration Plug-in, restart the Traffic Security task.

• Traffic Security does not work with Yandex.Disk, Dropbox.

• VPN limitations: there might appear issues when working via the Microsoft VPN connection protocols.

• If the installation is performed via Kaspersky Security Center in the Driver Interceptor mode, Traffic Security blocks the connection from Microsoft Management Console (hereinafter referred to as MMC) to the Kaspersky Security Center Administration Server, as such connection type uses the untrusted certificate.

• The component blocks connection to sites which use old technologies of generating root certificates, for example, sha1 certificate.

• The **Do not scan objects larger than (MB)** value cannot exceed 100Mb. If the large value is specified and the Internet connection speed is slow, there might be difficulties when receiving large files. The recommended value is 20 Mb.

• The application recognizes HTTPS connections as dangerous and blocks them if the following conditions are satisfied:
  • The task runs in the **Driver Interceptor** mode.
  • Traffic is redirected from external devices.
  • The devices from which traffic is redirected are protected by Kaspersky Security for Windows Server and the preset Traffic Security task has been run at least once.

We do not recommend using **Redirector** mode to check traffic redirected from external computers: besides the aforementioned false positives, such a configuration may cause high server load and reduce application performance.

### File Integrity Monitor

By default, the File Integrity Monitor does not monitor changes in system folders or the file system's housekeeping files, in order to prevent information about routine file changes, which are performed constantly by the operating system, from getting into the task reports. The user cannot manually include such folders in the monitoring scope.

The following folders/files are excluded from the monitoring scope:

• NTFS housekeeping files with file id from 0 to 33

• "%SystemRoot%\Prefetch\"

• "%SystemRoot%\ServiceProfiles\LocalService\AppData\Local\"

• "%SystemRoot%\System32\LogFiles\Scm\"
The application excludes top-level folders.

The component does not monitor files changes that bypass the ReFS/NTFS file system (file changes made through BIOS, LiveCD, etc.).

Firewall Management

- Working with IP addresses in IPv6 format is not available when specified applied rule scope consists of one address.
- Preset Firewall policy rules provide execution of basic scenarios of interaction between local computers and Administration Server. For full usage of Kaspersky Security Center functions, it is required to set up rules for ports manually. Information about port numbers, protocols and their functions is contained in Kaspersky Security Center Knowledge base (article ID: 9297).
- The application does not control modification of Windows Firewall rules and rule groups during the minutely inquiries of the Firewall management task, if those rules were not added to the task configuration upon the application installation. To update the status and include such rules the Firewall management task must be restarted.
- For the Microsoft Windows Server family of operating systems, 2008 and higher: the Windows Firewall service must be started (started by default) before installing the Firewall Management component.
- When the Firewall Management task is started, the following types of rules are automatically removed from the operating system's firewall settings:
  - denying rules;
  - rules monitoring outgoing traffic.
Other limitations

On-Demand Scan, Real-Time File Protection:

- Connected MTP-devices scanning is not available.
- Archive object scanning is not available without SFX-archive scanning: if archive scanning is enabled in the protection settings of Kaspersky Security for Windows Server, the application automatically scans objects in both archives and SFX-archives. SFX-archives scanning without archives scanning is available.

Computer control and diagnostics:

- Protection scope of the Device Control task includes MTP-connected devices, if a protected computer is running on Microsoft Windows Server 2008 R2 or higher operating systems.
- Log Inspection task only detects potential Kerberos attack patterns (MS14-068) on computers running on Windows Server 2008 or higher as a domain controller with installed updates.

Licensing:

- Application activation with the key via the Setup wizard is not available, if the key is stored on the disk, which was created with the SUBST command, or if the network path to the key file is specified.

Updates:

- After the installation of Kaspersky Security for Windows Server critical modules updates, the application icon is hidden by default.
- KLRAMDISK is not supported on computers running Windows XP or Windows 2003 operating system.

Interface:

- If you use filtering in the Application Console in the Quarantine, Backup, System audit log or Task log, the case should be maintained.
- You can use only one mask and only in the path end, when configuring protection or scan scope in the Application Console. Correct mask usage examples: "C:\Temp\Temp\", or "C:\Temp\Temp***.doc", or "C:\Temp\Temp*.doc". Limitation does not affect Trusted Zone configuration.

Security:

- If the User Account Control in the operating system settings is activated, a user account must be a part of KAVWSEE Administrators group to open the Application Console with a double-click on the application icon in the tray notification area. In other case, it will be necessary to login as a user, which is allowed to open the Compact Diagnostic Interface or MMC snap-in.
- Application uninstallation via the “Programs and Features” window of Microsoft Windows is not available if the User Account Control is activated.

Integration with Kaspersky Security Center:

- Administration Server checks the database updates validity when receiving the update packages, and before sending the updates to network computers. Administration Server does not check validity of the received software module updates.
- Make sure the required check boxes are selected in the Interaction with the Administration Server settings, when you use the components that transmit the dynamically changed data to Kaspersky Security Center with the help of network lists (Quarantine, Backup, Blocked hosts).
Exploit Prevention:

- Exploit Prevention is not available if apphelp.dll libraries are not loaded in the current environment configuration.
- The Exploit Prevention component is incompatible with Microsoft’s EMET utility on computers running the Microsoft Windows 10 operating system: Kaspersky Security for Windows Server blocks EMET, if the Exploit Prevention component is being installed on a computer with EMET installed.

Anti-Cryptor for NetApp:

- Anti-Cryptor protection cannot be provided for NASes running new operating systems (ONTAP 9 and higher) if FlexGroup containers are used for these servers.
- File threats detection functionality on network attached storages NetApp in 7 Mode is limited.
- Anti-Cryptor for NetApp is available in the cluster mode only.
- A server can use only one network interface and only one IPv4 address.

Blocked Host Storage: runs continuously when the Anti-Cryptor or Real-Time File Protection components are enabled.

ICAP Network Storage Protection:

- Management of the contents of the protected storage depends on the storage settings. For example, detected infected objects cannot be deleted if the storage does not allow this action.
- HPE 3PAR storage only works in block access mode.
- If an exclusion rule for not-a-virus objects is active within the Trusted Zone, it is also applied to the ICAP Network Storage Protection task.

RPC Network Storage Protection: Active Directory is required for the cluster mode.

KSN Usage: For Windows Vista and earlier versions of Windows operating systems, this component does not support statistics for web threat protection and mail threat protection.
Installing and removing the application

This section provides step-by-step instructions for installing and removing Kaspersky Security for Windows Server.

In this chapter

Kaspersky Security for Windows Server software component codes for the Windows Installer service

By default, `server\ks4ws_x86(x64).msi` files are designed to install all Kaspersky Security for Windows Server components. You can install these components by including them in a custom installation.

The `client\ks4wstools_x86(x64).msi` files install all software components in the "Administration Tools" set.

The following sections list the Kaspersky Security for Windows Server component codes for the Windows Installer service. These codes can be used to define a list of components to be installed when installing Kaspersky Security for Windows Server from the command line.

In this section

- Kaspersky Security for Windows Server software components: 36
- "Administration tools" set of software components: 39
Kaspersky Security for Windows Server software components

The following table contains codes for and a description of Kaspersky Security for Windows Server software components.

<table>
<thead>
<tr>
<th>Component</th>
<th>Code</th>
<th>Functions performed</th>
</tr>
</thead>
<tbody>
<tr>
<td>Basic functionality</td>
<td>Core</td>
<td>This component contains the set of basic application functions and ensures their operation.</td>
</tr>
<tr>
<td>Applications Launch Control</td>
<td>AppCtrl</td>
<td>This component monitors user attempts to run applications and allows or denies application launch in accordance with specified Applications Launch Control rules. It is implemented in the Applications Launch Control task.</td>
</tr>
<tr>
<td>Device Control</td>
<td>DevCtrl</td>
<td>This component tracks attempts to connect USB mass storage devices to a protected server and allows or denies use of these devices according to the specified device control rules. The component is implemented in the Device Control task.</td>
</tr>
<tr>
<td>Traffic Security</td>
<td>WebGW</td>
<td>This component processes web traffic (including traffic received via the mail services) and intercepts and scans objects transferred through web traffic to detect known computer and other threats on the protected server.</td>
</tr>
</tbody>
</table>
| Anti-Virus protection          | AVProtection | This component provides anti-virus protection and contains the following components:  
On-Demand Scan  
Real-Time File Protection |
| On-Demand Scan                 | Ods    | This component installs Kaspersky Security for Windows Server system files and provides On-Demand scan tasks (scanning of objects on the protected server upon request).  
If other Kaspersky Security for Windows Server components are specified when installing Kaspersky Security for Windows Server from the command line, but the Core component is not specified, the Core component is installed automatically. |
<table>
<thead>
<tr>
<th>Component</th>
<th>Code</th>
<th>Functions performed</th>
</tr>
</thead>
<tbody>
<tr>
<td>Real-Time File Protection</td>
<td>Oas</td>
<td>This component performs anti-virus scans of files on the protected server when these files are accessed. It implements the Real-Time File Protection task.</td>

System changes after Kaspersky Security for Windows Server installation

When Kaspersky Security for Windows Server and the set of "Administration Tools" (including the Application Console) are installed together, the Windows Installer service will make the following modifications on the protected server:

- Kaspersky Security for Windows Server folders are created on the protected server and on the server where the Application Console is installed.
- Kaspersky Security for Windows Server services are registered.
- A Kaspersky Security for Windows Server user group is created.
- Kaspersky Security for Windows Server keys are registered in the system registry.

These changes are described below.
Kaspersky Security for Windows Server folders on a protected server

When Kaspersky Security for Windows Server is installed, the following folders are created on a protected server:

- Kaspersky Security for Windows Server default installation folder containing the Kaspersky Security for Windows Server executable files depend on the operating system bit set. Therefore, the default installation folders are as follows:
  - On the 32-bit version of Microsoft Windows: %ProgramFiles%\Kaspersky Lab\Kaspersky Security for Windows Server\
  - On the 64-bit version of Microsoft Windows: %ProgramFiles(x86)%\Kaspersky Lab\Kaspersky Security for Windows Server\
- Management Information Base (MIB) files containing a description of the counters and hooks published by Kaspersky Security for Windows Server via the SNMP protocol:
  - %Kaspersky Security for Windows Server%\mibs
- 64-bit versions of Kaspersky Security for Windows Server executable files (this folder will be created only during installation of Kaspersky Security for Windows Server on the 64-bit version of Microsoft Windows):
  - %Kaspersky Security for Windows Server%\x64
- Kaspersky Security for Windows Server service files:
  - %ALLUSERSPROFILE%\Application Data\Kaspersky Lab\Kaspersky Security for Windows Server\10.1\Data\
  - %ALLUSERSPROFILE%\Application Data\Kaspersky Lab\Kaspersky Security for Windows Server\10.1\Settings\
  - %ALLUSERSPROFILE%\Application Data\Kaspersky Lab\Kaspersky Security for Windows Server\10.1\Dskm\
- Files with settings for update sources:
  - %ALLUSERSPROFILE%\Application Data\Kaspersky Lab\Kaspersky Security for Windows Server\10.1\Update\
- Updates of databases and software modules downloaded using the Copying Updates task (the folder will be created the first time updates are downloaded using the Copying Updates task):
  - %ALLUSERSPROFILE%\Application Data\Kaspersky Lab\Kaspersky Security for Windows Server\10.1\Update\Distribution\
- Task logs and system audit log:
  - %ALLUSERSPROFILE%\Application Data\Kaspersky Lab\Kaspersky Security for Windows Server\10.1\Reports\
- Set of databases currently in use:
  - %ALLUSERSPROFILE%\Application Data\Kaspersky Lab\Kaspersky Security for Windows Server\10.1\Bases\Current\
- Backup copies of databases; they are overwritten each time the databases are updated:
  - %ALLUSERSPROFILE%\Application Data\Kaspersky Lab\Kaspersky Security for Windows Server\10.1\Bases\Backup\
Temporary files created during execution of update tasks:

- %ALLUSERSPROFILE%\Application Data\Kaspersky Lab\Kaspersky Security for Windows Server\10.1\Bases\Temp\%

Quarantined objects (default folder):

- %ALLUSERSPROFILE%\Application Data\Kaspersky Lab\Kaspersky Security for Windows Server\10.1\Quarantine\%

Objects in backup (default folder):

- %ALLUSERSPROFILE%\Application Data\Kaspersky Lab\Kaspersky Security for Windows Server\10.1\Backup\%

Objects restored from backup and quarantine (default folder for restored objects):

- %ALLUSERSPROFILE%\Application Data\Kaspersky Lab\Kaspersky Security for Windows Server\10.1\Restored\%

Folder created during installation of Application Console

The Application Console default installation folders containing the "Administration Tools" files depend on the operating system bit set. Therefore, the default installation folders are as follows:

- On the 32-bit version of Microsoft Windows: %ProgramFiles%\Kaspersky Lab\Kaspersky Security for Windows Server\Admins Tools\%
- On the 64-bit version of Microsoft Windows: %ProgramFiles(x86)%\Kaspersky Lab\Kaspersky Security for Windows Server\Admins Tools\%

Kaspersky Security for Windows Server services

The following Kaspersky Security for Windows Server services start using the local system (SYSTEM) account:

- Kaspersky Security Management Service (KAVFSGT) – this service is intended for Kaspersky Security for Windows Server application management through the Application Console.
- Kaspersky Security Exploit Prevention Service (KAVFSSLP) – a service that acts as an intermediary to communicate security settings to external security agents, and to receive data about security events.
- Kaspersky Security Script Checker Service (KAVFSSCS) – this service is started along with the Script Monitoring task and allows to control the execution of scripts created using Microsoft Windows Script Technologies.

Kaspersky Security for Windows Server group

KAVWSEE Administrators is a group on the protected server, which users have full access to the Kaspersky Security Management Service and to all Kaspersky Security for Windows Server functions.

System registry keys

When Kaspersky Security for Windows Server is installed, the following system registry keys are created:

- Properties of the Kaspersky Security for Windows Server:
  [HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\KAVFS]
- Kaspersky Security for Windows Server event log settings (Kaspersky Event Log):
  [HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Eventlog\Kaspersky Security]
• Properties of the Kaspersky Security for Windows Server management service:
  [HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\KAVFSGT]

• Performance counter settings:
  • On the 32-bit version of Microsoft Windows:
    [HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Kaspersky Security\Performance]
  • On the 64-bit version of Microsoft Windows:
    [HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\Kaspersky Security x64\Performance]

• SNMP Protocol Support component settings:
  • On the 32-bit version of Microsoft Windows:
    [HKEY_LOCAL_MACHINE\SOFTWARE\KasperskyLab\WSEE\10.1\SnmpAgent]
  • On the 64-bit version of Microsoft Windows:
    [HKEY_LOCAL_MACHINE\SOFTWARE\Wow6432Node\KasperskyLab\WSEE\10.1\SnmpAgent]

• Dump file settings:
  • On the 32-bit version of Microsoft Windows:
    [HKEY_LOCAL_MACHINE\SOFTWARE\KasperskyLab\WSEE\10.1\CrashDump]
  • On the 64-bit version of Microsoft Windows:
    [HKEY_LOCAL_MACHINE\SOFTWARE\Wow6432Node\KasperskyLab\WSEE\10.1\CrashDump]

• Trace file settings:
  • On the 32-bit version of Microsoft Windows:
    [HKEY_LOCAL_MACHINE\SOFTWARE\KasperskyLab\WSEE\10.1\Trace]
  • On the 64-bit version of Microsoft Windows:
    [HKEY_LOCAL_MACHINE\SOFTWARE\Wow6432Node\KasperskyLab\WSEE\10.1\Trace]

• Configuration of the application's tasks and functions:
  [HKEY_LOCAL_MACHINE\SOFTWARE\Wow6432Node\KasperskyLab\WSEE\10.1\Environment]

Kaspersky Security for Windows Server processes

Kaspersky Security for Windows Server starts processes described in the table below.

<table>
<thead>
<tr>
<th>File name</th>

</table>

## Installation and uninstallation settings and command line options for the Windows Installer service

This section contains descriptions of the settings for installing and uninstalling Kaspersky Security for Windows Server, their default values, keys for changing the installation settings, and their possible values. These keys can be used in conjunction with standard keys for the Windows Installer service’s `msiexec` command when installing Kaspersky Security for Windows Server from the command line.

### Installation settings and command line options in Windows Installer

- **Acceptance of the terms of the End User License Agreement**: you must accept the terms to install Kaspersky Security for Windows Server.
  - The possible values for `EULA=<value>` command line option are as follows:
    - 0 – you reject the terms of the End User License Agreement (default value).
    - 1 – you accept the terms of the End User License Agreement.
- **Acceptance of the terms of the Privacy Policy**: you must accept the terms to install Kaspersky Security for Windows Server.
  - The possible values for `PRIVACYPOLICY=<value>` command line option are as follows:
    - 0 – you reject the terms of the Privacy Policy (default value).
    - 1 – you accept the terms of the Privacy Policy.
- **Installation of Kaspersky Security for Windows Server with a preliminary scan of active processes and the boot sectors of local disks**.
  - The possible values for `PRESCAN=<value>` command line option are as follows:
    - 0 – do not perform a preliminary scan of active processes and the boot sectors of local disks during the installation (default value).
    - 1 – perform a preliminary scan of active processes and the boot sectors of local disks during the installation.
• Destination folder where Kaspersky Security for Windows Server files will be saved during installation. A different folder can be specified.

The default values for INSTALLDIR=<full path to the folder> command line option are as follows:

- Kaspersky Security for Windows Server: %ProgramFiles%\Kaspersky Lab\Kaspersky Security for Windows Server
- Administration tools: %ProgramFiles%\Kaspersky Lab\Kaspersky Security for Windows Server Admin Tools
- On the x64-bit version of Microsoft Windows: %ProgramFiles(x86)%

The possible values for RUNRTP=<value> command line option are as follows:

- 1 – start (default value).
- 0 – do not start.

• Protection exclusions recommended by Microsoft Corporation. In the Real-Time File Protection task exclude from the protection scope objects on the server that Microsoft Corporation recommends to exclude. Some applications on the server may become unstable when an anti-virus application intercepts or modifies the files they use. For example, Microsoft Corporation includes some domain controller applications in the list of such objects.

The possible values for ADDMSEXCLUSION=<value> command line option are as follows:

- 1 – exclude (default value).
- 0 – do not exclude.

• Objects excluded from the protection scope according to Kaspersky Lab recommendations. In the Real-Time File Protection task exclude from the protection scope objects on the server that Kaspersky Lab recommends to exclude.

The possible values for ADDKLEXCLUSION=<value> command line option are as follows:

- 1 – exclude (default value).
- 0 – do not exclude.

• Allow remote connection to the Application Console. By default, remote connection is not allowed to the Application Console installed on the protected server. During the installation, you can allow connection. Kaspersky Security for Windows Server creates allowing rules for the process kavfsgt.exe using the TCP protocol for all ports.

The possible values for ALLOWREMOTECON=<value> command line option are as follows:

- 1 – allow.
- 0 – deny (default value).

• Path to the key file. By default, the Windows Installer attempts to find the file with .key extension in the \server folder of the distribution kit. If the \server folder contains several key files, the Windows Installer will select the key file that has the farthest expiration date. A key file can be saved beforehand in the \server folder or by specifying another path to the key file using the Add key setting. You can add a key after Kaspersky Security for Windows Server is installed using an administrative tool of your choice: for example,
the Application Console. If you do not add a key during installation of the application, Kaspersky Security for Windows Server will not function.

The default value for \texttt{LICENSEKEYPATH}=<key file name> is \\server folder name in the distribution kit.

- Path to the configuration file. Kaspersky Security for Windows Server imports settings from the specified configuration file created in the application. Kaspersky Security for Windows Server does not import passwords from the configuration file, for example, account passwords for starting tasks, or passwords for connecting to a proxy server. Once the settings are imported, you will have to enter all passwords manually. If the configuration file is not specified, the application will start to work with the default settings after setup.

The default default value for \texttt{CONFIGPATH}=<configuration file name> is not specified.

- Enabling network connections for the Application Console. Use this option to install Kaspersky Security for Windows Server on another server. You can remotely manage server protection from another computer with the Kaspersky Security for Windows Server Console installed. Port 135 (TCP) is opened in Microsoft Windows Firewall, network connections are allowed for the executable file kavfsrcn.exe for remote management of Kaspersky Security for Windows Server, and access is granted to DCOM applications. When installation is complete, add users to the KAVWSEE Administrators group to let them remotely manage the application, if the server operates on the Microsoft Windows Server 2008, and allow network connections to the Kaspersky Security Management Service (kavfsgr.exe file) on the server. You can read more about additional configuration when the Kaspersky Security for Windows Server Console is installed on another computer (see Section "Advanced settings after installation of the Application Console on another computer" on page 54).

The possible values for \texttt{ADDFEXCLUSION}=<value> command line option are as follows:

- 1 – allow.
- 0 – deny (default value).

- Disabling the check for incompatible software. Use this setting to enable or disable the check for incompatible software during background installation of the application on the server. Regardless of the value of this setting, during installation of Kaspersky Security for Windows Server, the application always warns about other versions of the application installed on the server.

The possible values for \texttt{SKIPINCOMPATIBLESW}=<value> command line option are as follows:

- 0 – The check for incompatible software is performed (default value).
- 1 – The check for incompatible software is not performed.

Uninstallation settings and command line options in Windows Installer

- Restoring quarantined objects.

The possible values for \texttt{RESTOREQTN}=<value> command line option are as follows:

- 0 – Remove quarantined content (default value).
- 1 – Restore quarantined content to the folder specified by the RESTOREPATH parameter into the \Quarantine subfolder.
• Restoring the content of backup.
  The possible values for RESTOREBCK=<value> command line option are as follows:
  • 0 – Remove backup content (default value).
  • 1 – Restore backup contents to the folder specified by the RESTOREPATH parameter into the \Backup subfolder.
• Enter the current password to confirm the uninstallation (if password protection is enabled).
  The default value for UNLOCK_PASSWORD=<specified password> is not specified.
• Folder for restored objects. Restored objects will be saved to the specified folder.
  The default value for RESTOREPATH=<full path to the folder> command line option is %ALLUSERSPROFILE%\Application Data\Kaspersky Lab\Kaspersky Security for Windows Server\10.1\Restored.

Kaspersky Security for Windows Server install and uninstall logs

If Kaspersky Security for Windows Server is installed or uninstalled using the Installation (Uninstallation) Wizard, the Windows Installer service creates an install (uninstall) log. A log file named ks4ws_install_<uid>.log (where <uid> is a unique 8-character log identifier) will be saved in the %temp% folder for the user whose account was used to start the setup.exe file.

If you run the Modify or Remove Kaspersky Security 10.1.2 for Windows Server Administration Tools option for the Application Console or Kaspersky Security for Windows Server from the Start menu, a log file named ks4ws_10.1_maintenance.log is automatically created in the %temp% folder.

If Kaspersky Security for Windows Server is installed or uninstalled from the command line, the install log file will not be created by default.

► To install Kaspersky Security for Windows Server and create a log file on disk C:\:

• msiexec /i ks4ws_x86.msi /i /v C:\ks4ws.log /qn EULA=1 PRIVACYPOLICY=1
• msiexec /i ks4ws_x64.msi /i /v C:\ks4ws_log /qn EULA=1 PRIVACYPOLICY=1

Installation planning

This section describes the set of Kaspersky Security for Windows Server administration tools, and special aspects of installing and uninstalling Kaspersky Security for Windows Server using a wizard (see Section "Installing and uninstalling the application using a wizard" on page 49), command line (see Section "Installing and uninstalling the application from the command line" on page 65), using Kaspersky Security Center (see Section "Installing and uninstalling the application using Kaspersky Security Center" on page 71) and via an Active Directory group policy (see Section "Installing and uninstalling via Active Directory group policies" on page 76).
Before starting installation of Kaspersky Security for Windows Server, plan the main stages of the installation.

1. Determine which administration tools will be used to manage and configure Kaspersky Security for Windows Server.
2. Select the necessary application components for installation (see Section "Kaspersky Security for Windows Server software component codes for the Windows Installer service" on page 35).
3. Select the installation method.

**In this section**

- Selecting administration tools ................................................................. 47
- Selecting the installation type ................................................................. 48

**Selecting administration tools**

Determine the administration tools that will be used to configure Kaspersky Security for Windows Server settings and to manage the application. Kaspersky Security for Windows Server can be managed using the Application Console, command-line utility, and Kaspersky Security Center Administration Console.

**Kaspersky Security for Windows Server Console**

Kaspersky Security for Windows Server Console is a standalone snap-in added to the Microsoft Management Console. Kaspersky Security for Windows Server can be managed via the Application Console installed on the protected server or on another computer on the corporate network.

Multiple Kaspersky Security for Windows Server snap-ins can be added to one Microsoft Management Console opened in author mode to use it to manage the protection of multiple servers with Kaspersky Security for Windows Server installed.

The Application Console is included in the set of "Administration Tools" application components.

**Command line utility**

You can manage Kaspersky Security for Windows Server from the command line of a protected server.

The command line utility is included in the Kaspersky Security for Windows Server software components group.

**Kaspersky Security Center**

If Kaspersky Security Center is used for centralized management of anti-virus protection of computers at your company, you can manage Kaspersky Security for Windows Server via the Kaspersky Security Center Administration Console.

The following components must be installed:

- **Module for integration with Kaspersky Security Center Network Agent.** This component is included in the Kaspersky Security for Windows Server software components group. It allows Kaspersky Security for Windows Server to communicate with the Network Agent. Install the module for integration with Kaspersky Security Center Network Agent on the protected server.

- **Kaspersky Security Center Network Agent.** Install this component on each protected server. This component supports interaction between Kaspersky Security for Windows Server installed on the server
Installing and removing the application

and Kaspersky Security Center Administration Console. The Network Agent installation file is included in the Kaspersky Security Center distribution kit folder.

- **Kaspersky Security 10.1.2 Administration Plug-in.** Additionally, install the Administration Plug-in for managing Kaspersky Security for Windows Server via the Administration Console on the server where the Kaspersky Security Center Administration Server is installed. This provides the interface for application management via Kaspersky Security Center. The Administration Plug-in installation file, `\server\klcfginst.exe`, is included in the Kaspersky Security for Windows Server distribution kit.

### Selecting the installation type

After specifying the software components for installation of Kaspersky Security for Windows Server (see Section "Kaspersky Security for Windows Server software component codes for the Windows Installer service" on page 35), you need to select the application installation method.

Select the installation method depending on the network architecture and the following conditions:

- Whether you need special Kaspersky Security for Windows Server installation settings, or the recommended installation settings (see Section "Installation and uninstallation settings and command line options for the Windows Installer service" on page 43).

- Whether the installation settings will be the same for all servers or specific to each server.

Kaspersky Security for Windows Server can be installed interactively using the Setup Wizard or in silent mode without user involvement, and can be invoked by running the installation package file with installation settings from the command line. A centralized remote installation of Kaspersky Security for Windows Server can be performed using Active Directory group policies or using the Kaspersky Security Center remote installation task.

Kaspersky Security for Windows Server can be installed and configured on a single server with its settings saved to a configuration file; the file can then be used to install Kaspersky Security for Windows Server on other servers (this ability does not exist when the application is installed using Active Directory group policies).

### Starting the Setup Wizard

The Setup Wizard can install the following:

- Kaspersky Security for Windows Server components (see Section "Kaspersky Security for Windows Server software components" on page 36) on a protected server out of a `\server\setup.exe` file included in the distribution kit.

- Kaspersky Security for Windows Server Console (see Section "Kaspersky Security for Windows Server Console installation" on page 52) from the `\client\setup.exe` file in the distribution kit on the protected server or another LAN host.

### Running the installation package file from the command line with the necessary installation settings

If the installation package file is started without command-line options, Kaspersky Security for Windows Server will be installed with the default settings. Kaspersky Security for Windows Server options can be used to modify the installation settings.

The Application Console can be installed on the protected server and / or administrator's workstation.

You can also use sample commands for the installation of Kaspersky Security for Windows Server and the Application Console (see Section "Installing and uninstalling the application from the command line" on page 65).
Centralized installation via Kaspersky Security Center

If Kaspersky Security Center is used in your network for managing networked servers' anti-virus protection, Kaspersky Security for Windows Server can be installed on multiple servers by using the remote installation task.

The servers on which you want to install Kaspersky Security for Windows Server using Kaspersky Security Center (see Section "Installing and uninstalling the application using Kaspersky Security Center" on page 71) may be in the same domain as Kaspersky Security Center in a different domain, or in no domain at all.

Centralized installation using Active Directory group policies

Active Directory group policies can be used to install Kaspersky Security for Windows Server on the protected server. The Application Console can be installed on the protected server or administrator's workstation.

Kaspersky Security for Windows Server can be installed using just the recommended installation settings.

The servers on which Kaspersky Security for Windows Server is installed using Active Directory group policies (see Section "Installing and uninstalling via Active Directory group policies" on page 76) must be located in the same domain and the same organizational unit. Installation is performed at server start before logging in to Microsoft Windows.

Installing and uninstalling the application using a wizard

This section describes the installation and uninstallation of Kaspersky Security for Windows Server and the Application Console by means of the Setup Wizard, and contains information about additional configuration of Kaspersky Security for Windows Server and actions to be performed upon installation.

In this section

Installing using the Setup Wizard ........................................................................................................................................... 49
Modifying the set of components and repairing Kaspersky Security for Windows Server ........................................... 60
Uninstalling using the Setup Wizard ....................................................................................................................................... 62

Installing using the Setup Wizard

The following sections contain information about installation of Kaspersky Security for Windows Server, the Application Console and the Microsoft Outlook Add-in.

► To install and proceed to use Kaspersky Security for Windows Server, take the following steps:

1. Install Kaspersky Security for Windows Server on a protected server.
2. Install the Application Console on the computers from which you intend to manage Kaspersky Security for Windows Server.
3. If the Application Console has been installed on any computer in the network, other than protected server, perform the additional configuration to allow Application Console users to manage Kaspersky Security for Windows Server remotely.
4. Install the Microsoft Outlook Add-in on the computer with Microsoft Outlook client installed.
In this section

Kaspersky Security for Windows Server installation ................................................................. 50
Kaspersky Security for Windows Server Console installation ...................................................... 52
Kaspersky Security Microsoft Outlook Add-in installation .......................................................... 53
Advanced settings after installation of the Application Console on another computer ................. 54
Actions to perform after Kaspersky Security for Windows Server installation ............................. 57

Kaspersky Security for Windows Server installation

Before installing Kaspersky Security for Windows Server, take the following steps:

- Make sure that the account which you are using to start the Setup Wizard belongs to the administrators group on the protected server.

After completing the actions described above, proceed with the installation procedure. Following the Setup Wizard instructions, specify the installation settings for Kaspersky Security for Windows Server. The Kaspersky Security for Windows Server installation process can be stopped at any step of the Setup Wizard. To do so, click the Cancel button in the Setup Wizard’s window.

You can read more about the installation (uninstallation) settings (see Section “Installation and uninstallation settings and command line options for the Windows Installer service” on page 43).

► To install Kaspersky Security for Windows Server using the Setup Wizard:

1. Start the setup.exe file on the server.
2. In the window that opens, in the Installation section, click the Install Kaspersky Security for Windows Server link.
3. In the welcome screen of the Kaspersky Security for Windows Server Setup Wizard, click the Next button.
   The End User License Agreement and Privacy Policy window opens.
4. Review the terms of the License Agreement and Privacy Policy.
5. If you agree to the terms and conditions of End User License Agreement and Privacy Policy, select the terms and conditions of this End User License Agreement and Privacy Policy describing the handling of data check boxes in order to proceed with the installation.
   
   If you do not accept the End User License Agreement and/or Privacy Policy the installation will be aborted.
6. Click the Next button.
   If the server has any compatible version of the application installed, the Previous version of the application detected window will open.
   If previous versions of the application are not detected, proceed to step 8 of these instructions.
7. To upgrade from the previous version of the application, click the **Install** button. The Setup Wizard will upgrade application to Kaspersky Security for Windows Server 10.1 and save compatible settings in the new version. On the upgrade completion, wizard will open the **Installation complete** window (proceed to the Step 15 of these instructions).

   The **Quick scan of the computer before installation** window opens.

8. In the **Quick scan of the computer before installation**, select the **Scan computer for viruses** check box to scan system memory and the boot sectors of the server local drives for threats. Click the **Next** button. On completion of the scanning procedure the wizard will open a window reporting the scan results.

   This window displays information about scanned server objects: the total number of scanned objects, the number of threats detected, the number of infected or probably infected objects detected, the number of dangerous or suspicious processes removed from memory by Kaspersky Security for Windows Server, and the number of dangerous or suspicious processes that the application was unable to remove.

   To see exactly which objects were scanned, click the **List of processed objects** button.

9. Click the **Next** button in the **Quick scan of the computer before installation** window.

   The **Custom installation** window opens.

10. Select the components to be installed.

    By default, all Kaspersky Security for Windows Server components are included in recommended installation set, except the Firewall Management and Script Monitoring component.

    The **SNMP Protocol Support** component of Kaspersky Security for Windows Server will only appear in the list of components suggested for installation if the Microsoft Windows SNMP service is installed on the server.

11. To cancel all changes, click the **Reset** button in the **Custom installation** window. Click the **Next** button.

12. In the **Select a destination folder** window:

    • If required, specify a folder to which Kaspersky Security for Windows Server files will be copied.

    • If required, review the information about available space on local drives by clicking the **Disk** button.

   Click the **Next** button.

13. In the **Advanced installation settings** window, configure the following installation settings:

    • **Enable real-time protection after installation of application**.

    • **Add Microsoft recommended files to exclusions list**.

    • **Add Kaspersky Lab recommended files to exclusions list**.

    Click the **Next** button.

14. In the **Import settings from configuration file** window:

    a. Specify the configuration file to import Kaspersky Security for Windows Server settings from an existing configuration file created in any compatible previous version of the application.

    b. Click the **Next** button.

15. In the **Activation of the application** window, do one of the following:

    • If you want to activate the application, specify a Kaspersky Security for Windows Server key file for application activation.

    • If you want to activate the application later, click the **Next** button.
• If a key file was previously saved in the `server` folder of the distribution kit, the name of this file will be displayed in the **Key** field.

• To add a key using a key file stored in another folder, specify the key file.

You cannot activate the application using an activation code via Setup Wizard. If you want to activate the application using activation code, you need to enter the code after installation.

Once the key file is added, license information will be shown in the window. Kaspersky Security for Windows Server displays the license’s calculated expiration date. The license term runs from the time when you add a key and expires no later than the expiration date of the key file.

Click the **Next** button to apply the key file in the application.

16. In the **Ready to install** window, click the **Install** button. The wizard will start the installation of Kaspersky Security for Windows Server components.

17. The **Installation complete** window opens when installation is complete.

18. Select the **View Release Notes** check box to view information about the release after the Setup Wizard is done.

19. Click **Finish**.

The Setup Wizard closes. Once installation is complete, Kaspersky Security for Windows Server is ready to use if you have added an activation key.

**Kaspersky Security for Windows Server Console installation**

Follow the instructions of the Setup Wizard to configure installation settings for the Application Console. The installation process can be stopped at any step of the wizard. To do so, click the **Cancel** button in the Setup Wizard window.

► **To install the Application Console, take the following steps:**

1. Make sure that the account you use to run the Setup Wizard belongs to the administrators group on the computer.

2. Run the setup.exe file on the server.

   The welcome window opens.

3. Click on the **Install Kaspersky Security for Windows Server Console** link.

   The Setup Wizard's welcome window opens.

4. Click the **Next** button.

5. Review the terms of the End User License Agreement in the opened window, and select the **I confirm that I have fully read, understood, and accept the terms and conditions of this End User License Agreement** check box in order to proceed with the installation.

6. Click the **Next** button.

   The **Advanced installation settings** window opens.
7. In the **Advanced installation settings** window:
   - If you intend to use the Application Console to manage Kaspersky Security for Windows Server installed on a remote computer, select the **Allow remote access** check box.
   - To open the **Custom installation** window and select components:
     a. Click the **Advanced** button.
        The **Custom installation** window opens.
     b. Select the "Administration Tools" components from the list.
        By default, all the components are installed.
     c. Click the **Next** button.

   You can find more detailed information about Kaspersky Security for Windows Server components (see Section "Kaspersky Security for Windows Server software component codes for the Windows Installer service" on page 35).

8. In the **Select a destination folder** window:
   a. If required, specify a different folder to which the files being installed should be saved.
   b. Click the **Next** button.

9. In the **Ready to install** window, click the **Install** button.

   The wizard will begin installing the selected components.

10. Click **Finish**.

    The Setup Wizard closes. The Application Console will be installed on the protected server.

If the "Administration tools" set has been installed on any computer in the network other than protected server, configure the advanced settings (see Section "Advanced settings after installation of the Application Console on another computer" on page 54).

**Kaspersky Security Microsoft Outlook Add-in installation**

Follow the instructions of the Setup Wizard to configure installation settings for the Microsoft Outlook Add-in. The installation process can be stopped at any step of the wizard. To do so, click the **Cancel** button in the Setup Wizard window.

You can install the Microsoft Outlook Add-in on the protected server only if Kaspersky Security for Windows Server and Microsoft Outlook mail client are installed.

▶ **To install the Microsoft Outlook Add-in, take the following steps:**

1. Make sure that the account you use to run the Setup Wizard belongs to the administrators group on the computer.
2. Run the setup.exe file on the server.

   The welcome window opens.
3. Click on the Install Kaspersky Security 10.1 Microsoft Outlook Add-in (x86) or Install Kaspersky Security 10.1 Microsoft Outlook Add-in (x64) link according to bitness of the installed Microsoft Outlook client.

   The Setup Wizard's welcome window opens.

4. Click the Next button.

5. Review the terms of the End User License Agreement in the opened window, and select the I confirm that I have fully read, understood, and accept the terms and conditions of this End User License Agreement check box in order to proceed with the installation.

6. Click the Next button.

   The Destination folder window opens.

7. In the Destination folder window:
   - If you want to change the destination folder, click the Change button.
     The Change destination folder window opens.
     a. Specify another destination folder.
     b. Click OK.
   - If you do not want to change the destination folder, click the Next button.

8. In the Ready to install window, click the Install button.

   The wizard will begin installing the selected components.

9. Click Finish.

   The Setup Wizard closes.

If Microsoft Outlook mail client is running during installation of the Add-in, you must restart it after completion of the installation.

Advanced settings after installation of the Application Console on another computer

If the Application Console has been installed on any computer in the network, other than a protected server, perform the following actions to allow users to manage Kaspersky Security for Windows Server remotely:

- Add Kaspersky Security for Windows Server users to the KAVWSEE Administrators group on the protected server.
- Allow network connections for the Kaspersky Security Management Service (kavfsgt.exe) (see Section “About access permissions for the Kaspersky Security Management Service” on page 232), if the protected server uses Windows Firewall or a third-party firewall.
- If the Allow remote access check box is not selected during installation of the Application Console on a computer running Microsoft Windows, manually allow network connections for the Application Console via the computer's firewall.

The Application Console on the remote computer uses the DCOM protocol to receive information about Kaspersky Security for Windows Server events (such as objects scanned, tasks completed, etc.) from the Kaspersky Security
Management Service on the protected server. You need to allow network connections for the Application Console in the Windows Firewall settings in order to establish connections between the Application Console and the Kaspersky Security Management Service.

On the remote computer, where the Application Console is installed, do the following:

- Make sure that anonymous remote access to COM applications is allowed (but not remote start and activation of COM applications).
- In Windows Firewall, open TCP port 135 and allow network connections for kavfsrcn.exe, the executable file of the Kaspersky Security for Windows Server remote management process.
  The client computer where the Application Console is installed uses TCP port 135 to access the protected server and to receive a response.
- Configure an outbound rule for Windows Firewall to allow the connection.

Unlike the traditional TCP/IP and UDP/IP services where a single protocol has a fixed port, DCOM dynamically assigns ports to remote COM objects. If a firewall exists between the client (where the Application Console is installed) and the DCOM endpoint (the protected server), a large range of ports must be opened.

The same steps should be applied to configure any other software or hardware firewall.

 ► If the Application Console is open while you configure the connection between the protected server and the computer on which the Application Console is installed:

1. Close the Application Console.
2. Wait until the Kaspersky Security for Windows Server remote management process kavfsrcn.exe is finished.
3. Restart the Application Console.
   The new connection settings will be applied.

In this section

- Allowing anonymous remote access to COM applications.......................................................................................... 56
- Allowing network connections for the Kaspersky Security for Windows Server remote management process ............................................................................................................................... 56
- Adding outbound rule for Windows Firewall .................................................................................................................. 57
Allowing anonymous remote access to COM applications

The names of settings may vary depending on the installed Windows operating system.

► To allow anonymous remote access to COM applications, take the following steps:

1. On the remote computer with the Kaspersky Security for Windows Server Console installed, open the Component Services console.
2. Select Start → Run.
3. Enter the command dcomcnfg.
4. Click OK.
5. Expand the Computers node in the Component Services console on your server.
6. Open the context menu on the My Computer node.
7. Select Properties.
8. On the COM Security tab of the Properties window, click the Edit Limits button in the Access permissions settings group.
9. Make sure that the Allow Remote Access check box is selected for the ANONYMOUS LOGON user in the Allow Remote Access window.
10. Click OK.

Allowing network connections for the Kaspersky Security for Windows Server remote management process

The names of settings may vary depending on the installed Windows operating system.

► To open TCP port 135 in Windows Firewall and to allow network connections for the Kaspersky Security for Windows Server remote management process, take the following steps:

2. Perform one of the following steps:
   • On Microsoft Windows XP or Microsoft Windows Vista:
     a. On Microsoft Windows XP SP2 or later, select Start > Windows Firewall.
        On Microsoft Windows Vista, select Start > Control Panel > Windows Firewall and in the Windows Firewall window select the Change settings command.
     b. In the Windows Firewall window (or Windows Firewall settings), click the Add port button on the Exclusions tab.
     c. In the Name field, specify the port name RPC (TCP/135) or enter another name, for example Kaspersky Security for Windows Server DCOM, and specify the port number (135) in the Port name field.
     d. Select the TCP protocol.
e. Click OK.

f. Click the Add button on the Exclusions tab.

- On Microsoft Windows 7 or later:
  a. Select Start > Control Panel > Windows Firewall.
  b. In the Windows Firewall window, select Allow a program or feature through Windows Firewall.
  c. In the Allow programs to communicate through Windows Firewall window click the Allow another program... button.

3. Specify the kavfsrcn.exe file in the Add Program window. It is located in the destination folder specified during installation of Kaspersky Security for Windows Server Console using Microsoft Management Console.

4. Click OK.

5. Click the OK button in the Windows Firewall (Windows Firewall settings) window.

Adding outbound rule for Windows Firewall

The names of settings may vary depending on the installed Windows operating system.

► To add the outbound rule for Windows Firewall, take the following steps:

2. In the Windows Firewall window, click the Advanced settings link.

   The Windows Firewall with Advanced Security window opens.

3. Select the Outbound Rules child node.

4. Click on the New Rule option in the Actions pane.

5. In the New Outbound Rule Wizard window that opens, select the Port option and click Next.

6. Select the TCP protocol.

7. In the Specific remote ports field specify the following ports range for allowing outgoing connections: 1024-65535.

8. In the Action window, select the Allow the connection option.

9. Save the new rule and close the Windows Firewall with Advanced Security window.

   The Windows Firewall will now allow network connections between the Application Console and Kaspersky Security Management Service.

Actions to perform after Kaspersky Security for Windows Server installation

Kaspersky Security for Windows Server starts protection and scan tasks immediately after installation if you have activated the application. If Enable real-time protection after installation of application (default option) is selected during installation of Kaspersky Security for Windows Server, the application scans the server's file system objects when they are accessed. If the Script monitoring component was installed during custom
installation, Kaspersky Security for Windows Server scans the program code of all scripts when they are run. Kaspersky Security for Windows Server will run the Critical Areas Scan task every Friday at 8:00 PM.

We recommend taking the following steps after installing Kaspersky Security for Windows Server:

- Start the application database update task. After installation Kaspersky Security for Windows Server will scan objects using the database included in the application distribution kit.

  We recommend updating Kaspersky Security for Windows Server databases immediately since they may be out of date.

  The application will then update the databases every hour according to the default schedule configured in the task.

- Run a Critical Areas Scan on the server if no anti-virus software with real-time file protection was installed on the protected server before installation of Kaspersky Security for Windows Server.

- Configure administrator notifications about Kaspersky Security for Windows Server events.

In this section

Starting and configuring Kaspersky Security for Windows Server Database Update task ........................................... 58
Critical Areas Scan .................................................................................................................................................. 60

Starting and configuring Kaspersky Security for Windows Server Database Update task

► To update the application database after installation, do the following:

  1. In the Database Update task settings, configure a connection to an update source – Kaspersky Lab HTTP or FTP update servers.
  2. Start the Database Update task.

Web Proxy Auto-Discovery Protocol (WPAD) may not be configured on your network to detect proxy server settings automatically in the LAN. At that, your network may require authentication when accessing the proxy server.

► To specify the optional proxy server settings and authentication settings for accessing the proxy server, do the following:

  1. Open the context menu of the Kaspersky Security node.
  2. Select the Properties item.
    The Application settings window opens.
  3. Select the Connection settings tab.
  4. In the Proxy server settings section, select the Use specified proxy server settings check box.
  5. Enter the proxy server address in the Address field, and enter the port number for the proxy server in the Port field.
6. In the **Proxy server authentication settings** section, select the necessary authentication method in the drop-down list:

- **Use NTLM authentication**, if the proxy server supports the built-in Microsoft Windows NTLM authentication. Kaspersky Security for Windows Server will use the user account specified in the task settings to access the proxy server (by default the task will run under the local system (SYSTEM) user account).

- **Use NTLM authentication with user name and password**, if the proxy server supports the built-in Microsoft Windows NTLM authentication. Kaspersky Security for Windows Server will use the specified account to access the proxy server. Enter a user name and password or select a user from the list.

- **Apply user name and password**, to select basic authentication. Enter a user name and password or select a user from the list.

7. Click **OK** in the **Application settings** window.

   ► To configure the connection to Kaspersky Lab's update servers, in the **Database Update task**:

   1. Start Application Console in one of the following ways:

   - Open the Application Console on the protected server. To do this, select **Start > All Programs > Kaspersky Security for Windows Server > Administration Tools > Kaspersky Security 10.1.2 for Windows Server Console**.

   - If the Application Console has been started on a server other than the protected one, connect to the protected server:
     a. Open the context menu of the **Kaspersky Security** node in the Application Console tree.
     b. Select the **Connect to another computer** item.
     c. In the **Select computer** window, select **Another computer** and in the text field indicate the network name of the protected server.

     If the account you used to sign in to Microsoft Windows does not have access permissions for the Kaspersky Security Management Service (see Section "About access permissions for the Kaspersky Security Management Service" on page 232), indicate an account with the required permissions.

   The Application Console window opens.

   2. In the Application Console tree, expand the **Update** node.

   3. Select the **Database Update** child node.

   4. Click the **Properties** link in the details pane.

   5. In the **Task settings** window that opens, open the **Connection settings** tab.

   6. Select **Use proxy server settings to connect to Kaspersky Lab update servers**.

   7. Click **OK** in the **Task settings** window.

   The settings for connecting to the update source in the Database Update task will be saved.
To run the Database Update task:

1. In the Application Console tree, expand the **Update** node.
2. In the context menu on the **Database Update** child node, select the **Start** item.

The Database Update task starts.

After the task has successfully completed, you can view the release date of the latest database updates installed in the details pane of the **Kaspersky Security** node.

---

**Critical Areas Scan**

After you have updated the Kaspersky Security for Windows Server databases, scan the server for malware using the Critical Areas Scan task.

To run the Critical Areas Scan task, take the following steps:

1. Expand the **On-Demand Scan** node in the Application Console tree.
2. In the context menu of the **Critical Areas Scan** child node, select the **Start** command.

The task starts; the **Running** task status is displayed in the details pane.

To view the task log, in the details pane of the **Critical Areas Scan** node, click the **Open task log** link.

---

**Modifying the set of components and repairing Kaspersky Security for Windows Server**

Kaspersky Security for Windows Server components can be added or removed. You need to stop the Real-Time File Protection task before you can remove the Real-Time File Protection component. In other circumstances there is no need to stop the Real-Time File Protection task or Kaspersky Security Service.

If application management is password protected, Kaspersky Security for Windows Server requests the password when you attempt to remove components or modify the set of components in the Setup Wizard.

To modify the set of Kaspersky Security for Windows Server components:

1. In the **Start** menu, select **All programs** > **Kaspersky Security for Windows Server** > **Modify or Remove Kaspersky Security for Windows Server**.

   The Setup Wizard's **Modify, repair or remove installation** window opens.

2. Select **Modify components set**. Click the **Next** button.

   The **Custom installation** window opens.
3. In the **Custom installation** window, in the list of available components, select the components that you want to add or remove from Kaspersky Security for Windows Server. To do this, perform the following actions:

   - To change the set of components, click the button next to the name of the selected component. Then in the context menu, select:
     - **Component will be installed on local hard drive**, if you want to install one component;
     - **Component and its subcomponents will be installed on local hard drive**, if you want to install a group of components.
   - To remove previously installed components, click the button next to the name of the selected component. Then in the context menu, select **Component will be unavailable**.

   Click the **Next** button.

4. In the **Ready to install** window, confirm the change to the set of software components by clicking the **Install** button.

5. In the window that opens when installation is complete, click the **OK** button.

   The set of Kaspersky Security for Windows Server components will be modified based on the specified settings.

If problems occur in the operation of Kaspersky Security for Windows Server (Kaspersky Security for Windows Server crashes; tasks crash or do not start), it is possible to attempt to repair Kaspersky Security for Windows Server. You can perform a repair while saving the current Kaspersky Security for Windows Server settings, or you can select an option to reset all Kaspersky Security for Windows Server settings to their default values.

► **To repair Kaspersky Security for Windows Server after the application or a task crashes, take the following steps:**

1. In the **Start** menu, select **All programs**.
2. Select **Kaspersky Security for Windows Server**.
3. Select **Modify or Remove Kaspersky Security for Windows Server**.
   
   The Setup Wizard's **Modify, repair or remove installation** window opens.
4. Select **Repair installed components**. Click the **Next** button.
   
   This opens the **Repair installed components** window.
5. In the **Repair installed components** window, select the **Restore recommended application settings** check box if you want to reset the application settings and restore Kaspersky Security for Windows Server with its default settings. Click the **Next** button.
6. In the **Ready to repair** window, confirm the repair operation by clicking the **Install** button.
7. In the window that opens when the repair operation is complete, click the **OK** button.

   Kaspersky Security for Windows Server will be repaired using the specified settings.
Uninstalling using the Setup Wizard

This section contains instructions on removing Kaspersky Security for Windows Server, the Application Console and the Microsoft Outlook Add-in from a protected server using the Setup / Uninstallation Wizard.

In this section

- Kaspersky Security for Windows Server uninstallation .......................................................... 62
- Kaspersky Security for Windows Server Console uninstallation ............................................. 63
- Kaspersky Security Microsoft Outlook Add-in uninstallation .................................................. 63

Kaspersky Security for Windows Server uninstallation

The names of settings may vary under different Windows operating systems.

Kaspersky Security for Windows Server can be uninstalled from the protected server using the Setup / Uninstallation Wizard.

After uninstalling Kaspersky Security for Windows Server from a protected server a reboot may be required. The reboot can be postponed.

Uninstallation, repair and installation of the application is not available via the Windows Control Panel if the operating system uses the UAC feature (User Account Control) or access to the application is password protected.

If application management is password protected, Kaspersky Security for Windows Server requests the password when you attempt to remove components or modify the set of components in the Setup Wizard.

► To uninstall Kaspersky Security for Windows Server:

1. In the Start menu, select All programs.
   The Setup Wizard's Modify, repair or remove installation window opens.
4. Select Remove software components. Click the Next button.
   The Advanced application uninstallation settings window opens.
5. If necessary, in the **Advanced application uninstallation settings** window:
   a. Select the **Export quarantine objects** check box to make Kaspersky Security for Windows Server export objects that have been quarantined. The check box is cleared by default.
   b. Check the **Export Backup objects** check box to export objects from Kaspersky Security for Windows Server Backup. The check box is cleared by default.
   c. Click the **Save to** button and select the folder to which you want to export the objects. By default, the objects will be exported to %ProgramData%\Kaspersky Lab\Kaspersky Security for Windows Server\Uninstall.
      Click the **Next** button.

6. In the **Ready to uninstall** window, confirm the uninstallation by clicking the **Uninstall** button.

7. In the window that opens when the uninstallation is complete, click the **OK** button.

Kaspersky Security for Windows Server will be uninstalled from the protected server.

### Kaspersky Security for Windows Server Console uninstallation

The names of settings may vary under different Windows operating systems.

You can uninstall the Application Console from the server using the Setup / Uninstallation Wizard.

After uninstalling the Application Console, you do not need to restart the server.

► **To uninstall the Application Console:**

1. In the **Start** menu, select **All programs**.
2. Select **Kaspersky Security for Windows Server**.
3. Select **Modify or Remove Kaspersky Security 10.1.2 for Windows Server Administration Tools**.
   The wizard’s **Modify, repair or remove installation** window opens.
4. Select **Remove software components** and click the **Next** button.
5. The **Ready to uninstall** window opens. Click the **Uninstall** button.
   The **Uninstallation complete** window opens.
6. Click **OK**.

Uninstallation is now complete, and the Setup Wizard closes.

### Kaspersky Security Microsoft Outlook Add-in uninstallation

► **To uninstall the Microsoft Outlook Add-in:**

1. Run the setup.exe file on the server.
   The Setup Wizard's welcome window opens.
2. Click the **Next** button.
   The **Repair or remove installation** window opens.
3. Click the **Remove** button.
   The **Ready to remove Kaspersky Security Microsoft Outlook Add-in** window opens.

4. Click the **Remove** button.
   The wizard will begin uninstalling the Microsoft Outlook Add-in.

5. Click **Finish**.
   Uninstallation is now complete, and the Setup Wizard closes.
Installing and uninstalling the application from the command line

This section describes the particulars of installing and uninstalling Kaspersky Security for Windows Server from the command line and contains examples of commands to install and uninstall Kaspersky Security for Windows Server from the command line, and examples of commands to add and remove Kaspersky Security for Windows Server components from the command line.

In this section

- About installing and uninstalling Kaspersky Security for Windows Server from command line ........................................... 65

About installing and uninstalling Kaspersky Security for Windows Server from command line

Kaspersky Security for Windows Server can be installed or uninstalled, and its components added or removed, by running the `\server\ks4ws_x86(x64).msi` installation package files from the command line after the installation settings have been specified using keys.

The "Administration Tools" set can be installed on the protected server or on another computer on the network to work with the Application Console locally or remotely. To do this, use the `\client\ks4wstools.msi` installation package.

Perform the installation using an account included in the administrators group on the server where the application is installed.

If one of the `\server\ks4ws_x86(x64).msi` files is run on the protected server without additional keys, Kaspersky Security for Windows Server will be installed with the recommended installation settings.

The set of components to be installed can be assigned using the ADDLOCAL command-line option by listing the codes for the selected components or sets of components.
Example commands for installing Kaspersky Security for Windows Server

This section provides examples of commands used to install Kaspersky Security for Windows Server.

On servers running a 32-bit version of Microsoft Windows, run the files with the x86 suffix in the distribution kit. On servers running a 64-bit version of Microsoft Windows, run the files with the x64 suffix in the distribution kit.

Detailed information about the use of Windows Installer’s standard commands and command-line options is provided in the documentation supplied by Microsoft.

Examples of installing Kaspersky Security for Windows Server from the setup.exe file

► To install Kaspersky Security for Windows Server with the recommended installation settings without user involvement, run the following command:

```bash
\server\setup.exe /s /p EULA=1 PRIVACYPOLICY=1
```

► To install Kaspersky Security for Windows Server with the following settings:

- only install the Real-Time File Protection and On-Demand Scan components;
- do not run Real-Time Protection when starting Kaspersky Security for Windows Server;
- do not exclude files that Microsoft Corporation recommends to exclude from the scan scope;

perform the following command:

```bash
\server\setup.exe /p "ADDLOCAL=Oas RUNRTP=0 ADDMSEXCLUSION=0"
```

Examples of commands used for installation: running an .msi file

► To install Kaspersky Security for Windows Server with the recommended installation settings without user involvement, run the following command:

```bash
msiexec /i ks4ws.msi /qn EULA=1 PRIVACYPOLICY=1
```

► To install Kaspersky Security for Windows Server with the recommended installation settings and display the installation interface, run the following command:

```bash
msiexec /i ks4ws.msi /qf EULA=1 PRIVACYPOLICY=1
```

► To install and activate Kaspersky Security for Windows Server using the key file C:\0000000A.key:

```bash
msiexec /i ks4ws.msi LICENSEKEYPATH=C:\0000000A.key /qn EULA=1 PRIVACYPOLICY=1
```
To install Kaspersky Security for Windows Server with a preliminary scan of active processes and the boot sectors of local disks, run the following command:

```
msiexec /i ks4ws.msi PRESCAN=1 /qn EULA=1 PRIVACYPOLICY=1
```

To install Kaspersky Security for Windows Server in the installation folder C:\WSEE, run the following command:

```
msiexec /i ks4ws.msi INSTALLDIR=C:\WSEE /qn EULA=1 PRIVACYPOLICY=1
```

To install Kaspersky Security for Windows Server and save an installation log file named ks4ws.log in the folder where the Kaspersky Security for Windows Server msi file is stored, run the following command:

```
msiexec /i ks4ws.msi /l*v ks4ws.log /qn EULA=1 PRIVACYPOLICY=1
```

To install Kaspersky Security for Windows Server Console, run the following command:

```
msiexec /i ks4wstools.msi /qn EULA=1
```

To install the Microsoft Outlook Add-in for 64-bit Microsoft Outlook mail client, run the following command:

```
msiexec /i ksmail_x64.msi /qn EULA=1
```

To install the Microsoft Outlook Add-in for 32-bit Microsoft Outlook mail client, run the following command:

```
msiexec /i ksmail_x86.msi /qn EULA=1
```

To install and activate Kaspersky Security for Windows Server using the key file C:\0000000A.key and configure Kaspersky Security for Windows Server according to the settings in the configuration file C:\settings.xml, run the following command:

```
msiexec /i ks4ws.msi LICENSEKEYPATH=C:\0000000A.key CONFIGPATH=C:\settings.xml /qn EULA=1 PRIVACYPOLICY=1
```

To install an application patch when Kaspersky Security for Windows Server is password-protected, run the following command:

```
msiexec /p "<msp file name with path>" UNLOCK_PASSWORD=<password>
```

**Actions to perform after Kaspersky Security for Windows Server installation**

Kaspersky Security for Windows Server starts protection and scan tasks immediately after installation if you have activated the application. If you select **Enable real-time protection after installation of application** during installation of Kaspersky Security for Windows Server, the application scans the server's file system objects when they are accessed. If the Script monitoring component was installed during custom installation, Kaspersky Security for Windows Server scans the program code of all scripts when they are run. Kaspersky Security for Windows Server will run the Critical Areas Scan task every Friday at 8:00 P.M.
We recommend taking the following steps after installing Kaspersky Security for Windows Server:

- Start the Kaspersky Security for Windows Server Databases Update task. After installation Kaspersky Security for Windows Server will scan objects using the database included in its distribution kit. We recommend updating the Kaspersky Security for Windows Server database immediately. To do so, you must run the Database Update task. The database will then be updated every hour according to the default schedule.

  For example, you can run the Database Update task by running the following command:

  In this case, Kaspersky Security for Windows Server database updates are downloaded from Kaspersky Lab update servers. Connection to an update source is established via a proxy server (proxy server address: proxy.company.com, port: 8080) using built-in Windows NTLM authentication to access the server under an account (username: inetuser; password: 123456).

- Run a Critical Areas Scan of the server if no anti-virus software with real-time file protection was installed on the protected server before installation of Kaspersky Security for Windows Server.

  To start the Critical Areas Scan task using the command line:

  KAVSHELL SCANCRITICAL /W:scancritical.log

  This command saves the task log in a file named scancritical.log contained in the current folder.

- Configure administrator notifications about Kaspersky Security for Windows Server events.

Adding / removing components. Sample commands

The On-Demand Scan component is installed automatically. You do not need to specify it in the list of ADDLOCAL key values by adding or deleting Kaspersky Security for Windows Server components.

To add the Applications Launch Control component to the components that have already been installed, run the following command:

  msiexec /i ks4ws.msi ADDLOCAL=Oas,AppCtrl /qn

  or

  \server\setup.exe /s /p "ADDLOCAL=Oas,AppCtrl"

If you list the components you want to install along with the already installed components, Kaspersky Security for Windows Server will reinstall the existing components.

To remove installed components run the following command:

  msiexec /i ks4ws.msi
  "ADDLOCAL=Oas,Ods,Ksn,AntiExploit,DevCtrl,Firewall,AntiCryptor,LogInspector,AKIntegration,PerfMonCounters,SnmpSupport,Shell,TrayApp,AVProtection,RamDisk REMOVE=AppCtrl,Fim" /qn
Kaspersky Security for Windows Server uninstallation. Sample commands

► To uninstall Kaspersky Security for Windows Server from the protected server, run the following command:

```bash
msiexec /x ks4ws.msi /qn
```
or

- For 32-bit operating systems:
  ```bash
  msiexec /x {6607EF9A-4D10-4D3E-B255-6F280BFB3791} /qn
  ```
- For 64-bit operating systems:
  ```bash
  msiexec /x {93EDBC7E-D73F-4401-84A5-79E8CBB8B843} /qn
  ```

► To uninstall Kaspersky Security for Windows Server Console, run the following command:

```bash
msiexec /x ks4wstools.msi /qn
```
or

- For 32-bit operating systems:
  ```bash
  msiexec /x {54B7D218-5645-46DD-8660-41B336E1BD8A} /qn
  ```
- For 64-bit operating systems:
  ```bash
  msiexec /x {C10F9B07-7FC9-43C0-A5DC-B6CE8A817D76} /qn
  ```

► To uninstall Kaspersky Security for Windows Server from a protected server on which password protection is enabled, perform the following command:

- For 32-bit operating systems:
  ```bash
  msiexec /x {6607EF9A-4D10-4D3E-B255-6F280BFB3791} UNLOCK_PASSWORD=*** /qn
  ```
- For 64-bit operating systems:
  ```bash
  msiexec /x {93EDBC7E-D73F-4401-84A5-79E8CBB8B843} UNLOCK_PASSWORD=*** /qn
  ```

► To uninstall Microsoft Outlook Add-in, perform the following command:

- For 32-bit operating systems:
  ```bash
  msiexec /x {6AF88E70-817E-4FFE-8389-04A345E7A3D6} /qn
  ```
- For 64-bit operating systems:
  ```bash
  msiexec /x {410BC997-5B96-41B3-8B31-AAA074FE728B} /qn
  ```
## Return codes

- Installing the Application Console via Kaspersky Security Center ....................................................... 74
- Uninstalling Kaspersky Security for Windows Server via Kaspersky Security Center .............................. 75

General information about installing via Kaspersky Security Center

You can install Kaspersky Security for Windows Server via Kaspersky Security Center using the remote installation task.

After the remote installation task is complete, Kaspersky Security for Windows Server will be installed with identical settings on multiple servers.

All servers can be combined in a single administration group, and a group task can be created to install Kaspersky Security for Windows Server on the servers in this group.

You can create a task to remotely install Kaspersky Security for Windows Server on a set of servers that are not in the same administration group. When creating this task, you must generate the list of individual servers that Kaspersky Security for Windows Server should be installed on.

Detailed information on the remote installation task is provided in Kaspersky Security Center Help.
Rights to install or uninstall Kaspersky Security for Windows Server

The account specified in the remote installation (removal) task must be included in the administrators group on each of the protected servers in all cases except those described below:

- If the Kaspersky Security Center Network Agent is already installed on the servers on which Kaspersky Security for Windows Server is to be installed (regardless of which domain the servers are in or whether they belong to any domain).

  If the Network Agent is not yet installed on the servers, you can install it with Kaspersky Security for Windows Server using a remote installation task. Before installing the Network Agent, make sure that the account you want to specify in the task is included in the administrators group on each of the servers.

- All servers on which you want to install Kaspersky Security for Windows Server are in the same domain as the Administration Server, and the Administration Server is registered as the Domain Admin account (if this account has local administrator's rights on the servers within the domain).

By default, when using the Forced installation method, the remote installation task is run from the account running the Administration Server.

When working with group tasks or with tasks for sets of computers under forced installation (uninstallation) mode, an account must have the following rights on the client computer:

- Right to execute applications remotely.
- Rights to the Admin$ share.
- Right to Log on as a service.

Installing Kaspersky Security for Windows Server via Kaspersky Security Center

Detailed information about generating an installation package and creating a remote installation task is provided in the Kaspersky Security Center Implementation Guide.

If you intend to manage Kaspersky Security for Windows Server via Kaspersky Security Center in the future, make sure that the following conditions are met:

- The server where the Kaspersky Security Center Administration Server is installed also has the Administration Plug-in installed (server\klcfginst.exe file in the Kaspersky Security for Windows Server distribution kit).

- Kaspersky Security Center Network Agent is installed on protected servers. If Kaspersky Security Center Network Agent is not installed on protected servers, you can install it together with Kaspersky Security for Windows Server using a remote installation task.

Servers can also be combined into an administration group in order to later manage the protection settings using Kaspersky Security Center policies and group tasks.
To install Kaspersky Security for Windows Server using a remote installation task:

1. Start the Kaspersky Security Center Administration Console.
2. In Kaspersky Security Center, expand the Advanced node.
3. Expand the Remote installation child node.
4. In the details pane of the Installation packages child node, click the Create installation package button.
5. Select the Create installation package for a Kaspersky Lab application installation package type.
6. Enter the installation package name.
7. Specify the ks4ws.kud file from the Kaspersky Security for Windows Server distribution kit as the installation package file.

The End User License Agreement and Privacy Policy window opens.
8. If you agree to the terms and conditions of End User License Agreement and Privacy Policy, select the terms and conditions of this End User License Agreement and Privacy Policy describing the handling of data check boxes in order to proceed with the installation.

You must accept the License Agreement and the Privacy Policy to proceed.

9. To change the set of Kaspersky Security for Windows Server components to be installed (see Section "Modifying the set of components and repairing Kaspersky Security for Windows Server" on page 60) and the default installation settings (see Section "Installation and uninstallation settings and command line options for the Windows Installer service" on page 43) in the installation package:
   a. In Kaspersky Security Center, expand the Remote installation node.
   b. In the details pane of the Installation packages child node, open the context menu of the created Kaspersky Security for Windows Server installation package and select Properties.
   c. In the Properties: <name of installation package> window in the Settings section, do the following:
      a. In the Components to install settings group, select the check boxes next to the names of the Kaspersky Security for Windows Server components you want to install.
      b. In order to indicate a destination folder other than the default one, specify the folder name and path in the Destination folder field.
         The path to the destination folder may contain system environment variables. If the folder does not exist on the server, it will be created.
      c. In the Advanced installation settings group, configure the following settings:
         - Scan the server for viruses before installation.
         - Enable real-time protection after installation of application.
         - Add Microsoft recommended files to exclusions list.
         - Add Kaspersky Lab recommended files to exclusions list.
      d. If you want to import settings from the configuration file created in the previous version of Kaspersky Security for Windows Server, specify the required configuration file.
   d. In the Properties: <name of installation package> dialog window, click OK.
10. In the **Installation packages** node create a task to remotely install Kaspersky Security for Windows Server on the selected servers (administration group). Configure the task settings.

   To learn more about creating and configuring remote installation tasks, see the *Kaspersky Security Center Help*.

11. Run the Kaspersky Security for Windows Server remote installation task.

   Kaspersky Security for Windows Server will be installed on the servers specified in the task.

### Actions to perform after Kaspersky Security for Windows Server installation

After you install Kaspersky Security for Windows Server, we recommend that you update Kaspersky Security for Windows Server databases on the servers, and perform a Critical Areas Scan of the servers if no anti-virus applications with enabled real-time protection were installed on the servers before installation of Kaspersky Security for Windows Server.

If the servers on which Kaspersky Security for Windows Server was installed are part of the same administration group in the Kaspersky Security Center, you can perform these tasks using the following methods:

1. Create Database Update tasks for the group of servers on which Kaspersky Security for Windows Server was installed. Set the Kaspersky Security Center Administration Server as the update source.

2. Create an On-Demand Scan group task with the Critical Areas Scan status. Kaspersky Security Center evaluates the security status of each computer in the group based on the results of this task, not based on the results of the Critical Areas Scan task.

3. Create a new policy for the group of servers. In the policy properties, in the *Application settings* section, deactivate the scheduled start of system on-demand scan tasks and the Database Update tasks on the administration group’s servers in the settings of the *Run system tasks* subsection.

You can also configure administrator notifications about Kaspersky Security for Windows Server events.

### Installing the Application Console via Kaspersky Security Center

Detailed information about creating an installation package and a remote installation task is provided in the *Kaspersky Security Center Implementation Guide*.

► **To install the Application Console using a remote installation task:**

1. In the Kaspersky Security Center Administration Console expand the **Advanced** node.

2. Expand the **Remote installation** child node.

3. In the details pane of the Installation packages child node, click the **Create installation package** button.

   While creating the new installation package:

   a. In the **New Package Wizard** window, select **Create** an installation package for specified executable file as a package type.

   b. Enter the new installation package name.
c. Select the `client\setup.exe` file from the Kaspersky Security for Windows Server distribution kit folder and select the **Copy entire folder to the installation package** check box.

d. If required, use the ADDLOCAL command-line option to modify the set of components to be installed in the **Executable file launch settings (optional)** field and change the destination folder.

   For instance, in order to install the Application Console alone in the folder C:\KasperskyConsole without installing the help file and documentation, use the following command-line options:

   `/s /p "ADDLOCAL=MmcSnapin INSTALLDIR=C:\KasperskyConsole EULA=1"`

4. In the **Installation packages** child node, create a task to remotely install the Application Console on the selected servers (administration group). Configure the task settings.

   To learn more about creating and configuring remote installation tasks, see the Kaspersky Security Center Help.

5. Run the remote installation task.

   The Application Console is installed on the computers specified in the task.

---

**Uninstalling Kaspersky Security for Windows Server via Kaspersky Security Center**

If management of Kaspersky Security for Windows Server on network computers is password protected, enter the password when creating a task to uninstall multiple applications. If the password protection is not managed centrally by a Kaspersky Security Center policy, Kaspersky Security for Windows Server will be successfully uninstalled from the protected servers, on which the entered password matched the set value. Kaspersky Security for Windows Server will not be uninstalled from other computers.

► **In order to uninstall Kaspersky Security for Windows Server, take the following steps in the Kaspersky Security Center Administration Console:**

1. In the Kaspersky Security Center Administration Console, create and start an application removal task.

2. In the task, select the uninstallation method (similar to selecting the installation method; see the previous section) and specify the account that Administration Server will use to access the servers. You can uninstall Kaspersky Security for Windows Server with only the default uninstallation settings (see Section “Installation and uninstallation settings and command line options for the Windows Installer service” on page 43).
Installing and uninstalling via Active Directory group policies

This section describes installing and uninstalling Kaspersky Security for Windows Server via Active Directory group policies. It also contains information about actions to perform after installing Kaspersky Security for Windows Server through group policies.

In this section

- Installing Kaspersky Security for Windows Server via Active Directory group policies .................. 76
- Actions to perform after Kaspersky Security for Windows Server installation .............................. 77
- Uninstalling Kaspersky Security for Windows Server via Active Directory group policies .............. 77

Installing Kaspersky Security for Windows Server via Active Directory group policies

You can install Kaspersky Security for Windows Server on several servers via the Active Directory group policy. You can install the Application Console the same way.

The servers on which you want to install Kaspersky Security for Windows Server or the Application Console must be in the same domain and a single organizational unit.

The operating systems on the servers on which you want to install Kaspersky Security for Windows Server using the policy must be of the same bitness (32-bit or 64-bit).

You must have domain administrator rights.

To install Kaspersky Security for Windows Server, use the ks4ws_x86(x64).msi installation packages. To install the Application Console, use the ks4wstools.msi installation packages.

Detailed information about the use of Active Directory group policies is provided in the documentation supplied by Microsoft.

► To install Kaspersky Security for Windows Server (or the Application Console):

1. Save the msi file corresponding to the bitness (32- or 64-bit) of the installed version of the Microsoft Windows operating system in the public folder on the domain controller.

2. Save the key file (see Section "About the key file" on page 85) in the same public folder on the domain controller.
3. In the same public folder on the domain controller, create an install_props.json file with the contents below, which means that you accept the terms of the License Agreement and the Privacy Policy.

```json
{
    "EULA": "1",
    "PRIVACYPOLICY": "1"
}
```

4. On the domain controller create a new policy for the group that the servers belong to.

5. Using the Group Policy Object Editor, create a new installation package in the Computer Configuration node. Specify the path to the msi file for Kaspersky Security for Windows Server (or Application Console) in UNC (Universal Naming Convention) format.

6. Select the Windows Installer’s Always install with elevated privileges check box in both the Computer Configuration node and in the User Configuration node of the selected group.

7. Apply the changes using the `gpupdate /force` command.

Kaspersky Security for Windows Server will be installed on the computers of the group after they have been restarted.

**Actions to perform after Kaspersky Security for Windows Server installation**

After installing Kaspersky Security for Windows Server on the protected servers, it is recommended that you immediately update the application databases and run a Critical Areas Scan. You can perform these actions (see Section “Actions to perform after Kaspersky Security for Windows Server installation” on page 57) from the Application Console.

You can also configure administrator notifications about Kaspersky Security for Windows Server events.

**Uninstalling Kaspersky Security for Windows Server via Active Directory group policies**

If you used an Active Directory group policy to install Kaspersky Security for Windows Server (or the Application Console) on the group of servers, you can use this policy to uninstall Kaspersky Security for Windows Server (or the Application Console).

You can uninstall the application only with the default uninstallation parameters.

Detailed information about the use of Active Directory group policies is provided in the documentation supplied by Microsoft.

If application management is password protected, you cannot uninstall Kaspersky Security for Windows Server using Active Directory group policies.
To uninstall Kaspersky Security for Windows Server (or the Application Console):

1. On the domain controller, select the organizational unit from whose servers you want to uninstall Kaspersky Security for Windows Server or the Application Console.

2. Select the policy created for the installation of Kaspersky Security for Windows Server and in the Group Policies Object Editor, in the Software installation node (Computer Configuration > Software Settings > Software installation) open the context menu of the Kaspersky Security for Windows Server (or the Application Console) installation package and select the All tasks > Remove command.

3. Select the uninstallation method Immediately uninstall the software from users and computers.

4. Apply the changes using the `gpupdate / force` command.

Kaspersky Security for Windows Server is removed from the servers after they are restarted and before logging in to Microsoft Windows.

Checking Kaspersky Security for Windows Server functions. Using the EICAR test virus

This section describes the EICAR test virus and how to use the EICAR test virus to check the Real-Time Protection and On-Demand Scan features of Kaspersky Security for Windows Server.

In this section

- About the EICAR test virus ................................................................. 78
- Checking the Real-Time Protection and On-Demand Scan features ................................................. 79

About the EICAR test virus

This test virus is designed to verify the operation of anti-virus applications. It was developed by the European Institute for Computer Antivirus Research (EICAR).

The test virus is not a malicious object and does not contain executable code for your computer, but most vendors’ anti-virus applications identify it as a threat.

The file containing this test virus is called eicar.com. You can download it from the EICAR website http://www.eicar.org/anti_virus_test_file.htm.

Before saving the file in a folder on the computer’s hard drive, make sure that Real-Time File Protection is disabled on that drive.

The eicar.com file contains a line of text. When scanning the file Kaspersky Security for Windows Server detects the test threat in this line of text, assigns the Infected status to the file, and deletes it. Information about the threat detected in the file will appear in the Application Console and in the task log.
You can use the eicar.com file to check how Kaspersky Security for Windows Server disinfects infected objects and how it detects probably infected objects. To do this, open the file using a text editor, add one of the prefixes listed in the table below to the beginning of the line of text in the file, and save the file under a new name, e.g. eicar_cure.com.

To make sure that Kaspersky Security for Windows Server processes the eicar.com file with a prefix, in the **Objects protection** security settings section, set the **All objects** value for the Real-Time File Protection tasks and Default On-Demand Scan tasks of Kaspersky Security for Windows Server.

**Table 7.** Prefixes in EICAR files

<table>
<thead>
<tr>
<th>Prefix</th>
<th>File status after the scan and Kaspersky Security for Windows Server action</th>
</tr>
</thead>
<tbody>
<tr>
<td>No prefix</td>
<td>Kaspersky Security for Windows Server assigns the <strong>Infected</strong> status to the object and deletes it.</td>
</tr>
<tr>
<td>SUSP–</td>
<td>Kaspersky Security for Windows Server assigns the <strong>Probably infected</strong> status to the object detected by the heuristic analyzer and deletes it since probably infected objects are not disinfected.</td>
</tr>
<tr>
<td>WARN–</td>
<td>Kaspersky Security for Windows Server assigns the <strong>Probably infected</strong> status to the object (the object's code partly matches the code of a known threat) and deletes it since probably infected objects are not disinfected.</td>
</tr>
<tr>
<td>CURE–</td>
<td>Kaspersky Security for Windows Server assigns the <strong>Infected</strong> status to the object and disinfects it. If disinfection is successful, the entire text in the file is replaced with the word &quot;CURE&quot;.</td>
</tr>
</tbody>
</table>

**Checking the Real-Time Protection and On-Demand Scan features**

After installing Kaspersky Security for Windows Server, you can confirm that Kaspersky Security for Windows Server finds objects containing malicious code. To check this, you can use a test virus from EICAR (see Section “About the EICAR test virus” on page 78).

To check the Real-Time Protection feature, take the following steps:

   Before you save the file to the folder, make sure that Real-Time File Protection is disabled for the folder.

2. If you want to check that network user notifications are working, make sure that the Microsoft Windows Messenger Service is enabled both on the protected server and on the computer where you saved the eicar.com file.

3. Open the Application Console.
4. Copy the saved eicar.com file to the local drive of the protected server using one of the following methods:
   - To test notifications through a Terminal Services window, copy the eicar.com file to the server after connecting to the server using the Remote Desktop Connection utility.
   - To test notifications through the Microsoft Windows Messenger Service, use the computer's network places to copy the eicar.com file from the computer where you saved it.

Real-Time File Protection is working correctly if the following conditions are met:

- The eicar.com file is deleted from the protected server.
- In the Application Console, the task log is given the Critical status. The log has a new line with information about a threat in the eicar.com file. (To view the task log, in the Application Console tree, expand the Real-Time Server Protection node, select the Real-Time File Protection task and in the details panel of the node click the Open task log link).
- The following Microsoft Windows Messenger Service message appears on the computer from which you copied the file:

Make sure that the Microsoft Windows Messenger Service is running on the computer from which you copied the eicar.com file.

To check the On-Demand Scan feature, take the following steps:

Before you save the file to the folder, make sure that Real-Time File Protection is disabled for the folder.

2. Open the Application Console.

3. Do the following:
   a. Expand the On-Demand Scan node in the Application Console tree.
   b. Select the Critical Areas Scan child node.
   c. On the Scan scope settings tab, open the context menu on the Network node and select Add network file.
   d. Enter the network path to the eicar.com file on the remote computer in UNC (Universal Naming Convention) format.
   e. Select the check box to include the added network path in the scan scope.
   f. Run the Critical Areas Scan task.

The On-Demand Scan is working as it should if the following conditions are met:
- The eicar.com file is deleted from the computer's hard drive.
In the Application Console, the task log is given the *Critical* status. The Critical Areas Scan task log has a new line with information about a threat in the eicar.com file. (To view the task log, in the Application Console tree, expand the **On-Demand Scan** child node, select the Critical Areas Scan task and in the details panel, click the **Open task log** link).
Application interface

You can control Kaspersky Security for Windows Server using the Administration Plug-in and the local Application Console.

Actions in the local Application Console interface are described in the Working with the Application Console section (see Section "Working with the Kaspersky Security for Windows Server Console" on page 139).

The Kaspersky Security Center Administration Console interface is used to perform actions with the Administration Plug-in. See detailed information about the Kaspersky Security Center interface in the Kaspersky Security Center Help.
Application licensing

This section provides information about the main concepts related to licensing of the application.

In this chapter

About the End User License Agreement .......................................................... 83
About the license .............................................................................................. 84
About license certificate ................................................................................. 84
About key ......................................................................................................... 85
About the key file ............................................................................................ 85
About activation code ....................................................................................... 85
About subscription ........................................................................................... 86
About data provision ......................................................................................... 86
Activating the application with a license key .................................................. 89
Viewing information about the current license .............................................. 89
Functional limitations when the license expires ............................................. 91
Renewing the license ....................................................................................... 92
Deleting key ..................................................................................................... 92

About the End User License Agreement

The End User License Agreement is a binding agreement between you and AO Kaspersky Lab, stipulating the terms on which you may use the application.

Carefully review the terms of the End User License Agreement before you start using the application.

You can review the terms of the End User License Agreement in the following ways:

- During the Kaspersky Security for Windows Server installation
- By reading the file license.txt. This document is included in the application's distribution kit

By confirming that you agree with the End User License Agreement when installing the application, you signify your acceptance of the terms of the End User License Agreement. If you do not accept the terms of the End User License Agreement, you must abort application installation and must not use the application.
About the license

A license is a time-limited right to use the application, granted to you under the End User License Agreement. A valid license entitles you to receive the following services:

- Use of the application in accordance with the terms of the End User License Agreement
- Technical support

A commercial license is a paid license granted upon purchase of the application. When a commercial license expires, the application continues to run but some of its features become unavailable (for example, the application databases cannot be updated). To continue using all the features of Kaspersky Security for Windows Server, you must renew your commercial license.

Application functionality available under the commercial license depends on the choice of product. The selected product is indicated in the License Certificate (see Section "About license certificate" on page 84). Information on available products may be found at the Kaspersky Lab website https://www.kaspersky.com/small-to-medium-business-security.

To ensure maximum protection of your computer against security threats, we recommend renewing the license before it expires.

Make sure the additional key that you add has a later expiration date than the active one.

You cannot use a subscription as an additional key.

About license certificate

A license certificate is a document that you receive along with a key file or an activation code (if applicable). A license certificate contains the following information about the license provided:

- Order number
- Information about the user who has been granted the license
- Information about the application that can be activated under the license provided
- Limit of the number of licensing units (e.g., devices on which the application can be used under the license provided)
- License validity start date
- License expiration date or license term
- License type
About key

A key is a sequence of bits with which you can activate and subsequently use the application in accordance with the terms of the End User License Agreement. A key is generated by Kaspersky Lab.

You can add a key to the application by using a key file. After you add a key to the application, the key is displayed in the application interface as a unique alphanumeric sequence.

Kaspersky Lab can black-list a key over violations of the License Agreement. If your key is blocked, a different key must be added in order for the application to work.

A key may be an "active key" or an "additional key".

An active key is the key that the application currently uses to function. A key for a commercial or trial license may be added as the active key. The application can have no more than one active key.

An additional key is a key that confirms the right to use the application but is not currently in use. An additional key automatically becomes active when the license associated with the current active key expires. An additional key may be added only if there is an active key.

About the key file

A key file is a file with the .key extension provided to you by Kaspersky Lab. Key files are designed to activate the application by adding a license key.

You receive a key file at the email address that you provided when you bought Kaspersky Security for Windows Server or ordered the trial version of Kaspersky Security for Windows Server.

You do not need to connect to Kaspersky Lab activation servers in order to activate the application with a key file.

You can restore a key file if it has been accidentally deleted. You may need a key file to register a Kaspersky CompanyAccount, for example.

To restore your key file, perform any of the following actions:

- Contact the license seller.
- Receive a key file through Kaspersky Lab website (https://keyfile.kaspersky.com/en/) by using your available activation code.

About activation code

An activation code is a unique sequence of 20 letters and numbers. You have to enter an activation code in order to add a key for activating Kaspersky Security for Windows Server. You receive the activation code at the email address that you provided when you bought Kaspersky Security for Windows Server.

To activate the application with an activation code, you need Internet access in order to connect to Kaspersky Lab activation servers.

If you have lost your activation code after installing the application, it can be recovered. You may need the activation code to register a Kaspersky CompanyAccount, for example. To recover your activation code, contact Kaspersky Lab Technical Support.
About subscription

A subscription is a unique sequence of 20 letters and numbers. It provides the right to use the application within selected parameters (subscription end date, number of protected devices). A Kaspersky Security for Windows Server subscription can be registered with the service provider (for example, your ISP). You can extend a subscription manually or automatically, or cancel it. You can also suspend and then resume a subscription. Subscription management is available through the service provider; you cannot manage a subscription independently.

The subscription management options depend on the service provider. The service provider may offer a grace period for renewing a subscription.

A grace period is a time interval during which application functionality remains unchanged between the end of a subscription and its renewal.

A subscription can be limited or unlimited.

A limited subscription offers a limited license term and is not automatically renewed.

An unlimited subscription is automatically renewed without your involvement if payment is made on time, and does not have a fixed expiration date.

The status of a subscription is displayed in the details pane of the Kaspersky Security node and is updated automatically every hour. You cannot manually update the status of a subscription.

Activation codes obtained by subscription cannot be used to activate previous versions of the application.

About data provision

The License Agreement for Kaspersky Security for Windows Server, specifically the section entitled “Terms of data processing”, specifies the terms, liability, and procedure for sending and processing the data indicated in this Guide. Before accepting the License Agreement, carefully review its terms as well as all documents linked to by the License Agreement.

The data Kaspersky Lab receives from you when you use the application is protected and processed in accordance with the Privacy Policy available at www.kaspersky.com/Products-and-Services-Privacy-Policy.

By accepting the terms of the License Agreement, you agree to automatically send the following data to Kaspersky Lab:

- To support the mechanism for receiving updates – information about the installed application and its activation: identifier of the application being installed and its full version, including build number, type, and license identifier, installation identifier, update task identifier.
- To use the ability to navigate to Knowledge Base articles when application errors occur (Redirector service) – information about the application and link type, specifically: the name, locale, and full version number of the application, type of redirecting link, and error identifier.
- To manage confirmations for data processing – information about the status of acceptance of license agreements and other documents, that stipulate data transferring terms: identifier and version of the License Agreement or other document, as a part of which the data processing terms are accepted or
You can review the terms of the End User License Agreement in the following ways:

- During the application installation Kaspersky Security for Windows Server Installation Wizard displays full text of the License Agreement on a step of requesting the acceptance of the terms of the License Agreement.
- At any moment in the TXT file (license.txt), which contains the full License Agreement text. The file is included in the Kaspersky Security for Windows Server distribution kit, along with the application installation files.

Local data processing

While executing the application’s primary functions described in this Guide, Kaspersky Security for Windows Server locally processes and stores a sequence of data on the protected server.

Kaspersky Security for Windows Server locally processes and stores the following data:

- Information about scanned files and detected objects, for example, names and attributes of processed files and full paths to them on the scanned media, file types, actions taken on scanned files, accounts of users performing any actions on the protected network or protected server, names and data about scanned devices, information about processes running on the system, checksums (MD5, SHA-256) and timestamps of the executed files' processes, digital certificate attributes, data about executed scripts.
- Information about operating system activity and settings, for example, Windows Firewall settings, Windows Event Log entries, names of user accounts, starts of executable files, their checksums and attributes.
- Information about local network activity, including the IP addresses of blocked client computers.
- Information about scanned web addresses and downloaded files, for example URL and IP addresses where the download was started, download web page, protocol identifier and number of a port for connection, address harmfulness attribute, attributes and size of the file and its checksums (MD5, SHA-256), checksums (MD5, SHA-256) of the process executable file that downloaded the file, an attribute that specifies if the detection made during debugging, connection protocol identifier, used port number, URL address being scanned, the name of a scanned file, web certificate data.

Kaspersky Security for Windows Server processes and stores data as part of the application’s basic functionality, including to log application events and receive diagnostic data. Locally processed data is protected in accordance with the configured and applied application settings.

Kaspersky Security for Windows Server lets you configure the level of protection for data processed locally: you can change user privileges to access process data, change data retention periods for such data, entirely or partially disable functionality that involves data logging, and change the path and attributes of the folder where the data is logged.

Detailed information about configuring application functionality that involves data processing and default settings of processed data storage, can be found in the corresponding sections of this Guide.

The data processed by the application locally is not automatically sent to Kaspersky Lab or other third-party systems.

By default, all data locally processed by the application during operation is removed after Kaspersky Security for Windows Server removal from the server.

Exception applies to files with diagnostics information (trace and dump files) and the application events in the Windows Event Log - it is recommended to manually remove these files.
You can find the detailed information about working with files containing diagnostic data of the application in the corresponding sections of this Guide.

You can delete Windows Event Log files containing the program events of Kaspersky Security for Windows Server via standard means of the operating system.

**Local data processing by means of the application auxiliary components**

The Kaspersky Security for Windows Server installation package comprises the application auxiliary components, which can be installed on your server or computer even if Kaspersky Security for Windows Server is not installed on it. Such auxiliary components are:

- The Application Console. This component is included in the Kaspersky Security for Windows Server Administration Tools set and is represented by a Microsoft Management Console snap-in.
- Add-in for Microsoft Outlook email client. The component provides email anti-virus scan.
- The Administration Plug-in. This component provides a full integration with Kaspersky Security Center application.

While performing the main functions of the application described in this Guide, the application auxiliary components locally process and store a set of data on the server where they are installed, even if they are installed separately from Kaspersky Security for Windows Server.

The application components locally process and store the following data:

- The Application Console: the name of the server with installed Kaspersky Security for Windows Server (IP address or domain name) to which the Application Console last connected remotely; display parameters configured in the Microsoft Management Console snap-in; data about the last folder in which the user selected objects via the Application Console (by means of system dialog opened by clicking the **Browse** button). The Application Console trace files can also contain the following data: the name of the server with installed Kaspersky Security for Windows Server application to which the remote connection was established, the name of the user account under which the remote connection was established.

- The Add-in for Microsoft Outlook email client stores data only in trace files. The trace files of the Add-in for Microsoft Outlook email client may contain the following information: data from email messages' fields ("To", "From", "Subject"), metadata of the messages' bodies and attachments (type, size, name of the attachment).

- The Administration Plug-in can process and temporarily store data processed by Kaspersky Security for Windows Server; for example, configured parameters of the application tasks and components, parameters of Kaspersky Security Center policies, data sent in network lists.

The data processed by the auxiliary components is not automatically sent to Kaspersky Lab or other third-party systems.

By default, all data locally processed by the application auxiliary components during the operation is deleted after removal of these components.

The exceptions are trace files of the application auxiliary components, it is recommended to delete this files manually.

You can find the detailed information about working with files containing diagnostic data of the application auxiliary components in the corresponding sections of this Guide.
Activating the application with a license key

You can activate Kaspersky Security for Windows Server by applying a key.

If an active key has already been added to Kaspersky Security for Windows Server and you add another key as the active key, the new key replaces the previously added key. The previously added key is removed.

If an additional key has already been added to Kaspersky Security for Windows Server and you add another key as an additional key, the new key replaces the previously added key. The previously added additional key is removed.

If an active key and an additional key have already been added to Kaspersky Security for Windows Server and you add a new key as the active key, the new key replaces the previously added active key; the additional key is not removed.

To activate Kaspersky Security for Windows Server:

1. In the Application Console tree, expand the Licensing node.
2. In the details pane of the Licensing node, click the Add key link.
3. In the window that opens, click the Browse button and select a key file with the .key extension.

You can also add a key as an additional key. To add a key as an additional key, select the Use as additional key check box.

4. Click OK.

The selected key will be applied. Information about the added key will be available on the Licensing node.

Viewing information about the current license

Viewing licensing information

Information about the current license is displayed in the details pane of the Kaspersky Security node of the Application Console. A key can have the following statuses:

- **Checking the key status** – Kaspersky Security for Windows Server is checking the applied key file or activation code and waiting for a response about the current key status.

- **License expiration date** – Kaspersky Security for Windows Server has been activated until the specified date and time. The key status is highlighted in yellow in the following cases:
  - The license will expire in 14 days and no additional key file has been applied.
  - The added key has been blacklisted and is about to be blocked.

- **Application not activated** – Kaspersky Security for Windows Server is not activated because a key file or an activation code has not been applied. The status is highlighted in red.

- **License has expired** – Kaspersky Security for Windows Server is not activated because the license has expired. The status is highlighted in red.

- **End User License Agreement has been violated** – Kaspersky Security for Windows Server is not activated because the terms of the End User License Agreement (see Section “About the End User License Agreement” on page 83) have been violated. The status is highlighted in red.
- **Key is blacklisted** – The added key has been blocked and blacklisted by Kaspersky Lab, for example, if the key has been used by third parties to activate the application illegally. The status is highlighted in red.

- **Subscription suspended** – The subscription has been suspended temporarily. The status is highlighted in red. You can renew the subscription at any time.

**Viewing information about the current license**

- To view information about the current license,

  in the Application Console tree, expand the **Licensing** node.

General information about the current license is displayed in the details pane of the **Licensing** node (see the table below).

<table>

</tbody>
</table>

### Functional limitations when the license expires

When the current license expires, the following limitations are applied to the functional components:

- All tasks are stopped, except the Real-Time File Protection, On-Demand Scan and Application Integrity Control tasks.
- You cannot start any tasks except the Real-Time File Protection, On-Demand Scan and Application Integrity Control. These tasks continue to run using the old anti-virus databases.
- Exploit Prevention functionality is limited:
  - Processes are protected until they are restarted.
  - New processes cannot be added to the protection scope.

Other functions (repositories, logs, diagnostic information) are still available.
Renewing the license

By default, when the license has 14 days remaining before expiration, Kaspersky Security for Windows Server notifies you about the approaching expiration. In this case, the **License expiration date** status is highlighted in yellow in the details pane of the **Kaspersky Security** node.

You can renew the license before the expiration date using an additional key file or an activation code. This ensures that your server remains protected after expiration of the existing license and before you activate the application with a new license.

**To renew a license, take the following steps:**

1. Purchase a new activation code or a key file.
2. In the Application Console tree, open the **Licensing** node.
3. Perform one of the following actions in the details pane of the **Licensing** node:
   - If you want to renew a license using an additional key:
     a. Click the **Add** key link.
     b. In the window that opens, click the **Browse** button and select a new key file with the .key extension.
     c. Select the **Use as additional key** check box.
   - If you want to renew a license using an activation code:
     a. Click the **Add activation code** link.
     b. Enter the purchased activation code in the window that opens.
     c. Select the **Use as additional key** check box.

   **An Internet connection is required to apply an activation code.**

4. Click **OK**.

   The additional key will be added and automatically applied upon expiration of the current Kaspersky Security for Windows Server license.

Deleting key

You can remove the added key.

If an additional key has been added to Kaspersky Security for Windows Server and you remove the active key, the additional key automatically becomes the active key.

**If you delete an added key, you can restore it by re-applying the key file.**
To remove a key that has been added:

1. In the Application Console tree, select the Licensing node.
2. In the details pane of the Licensing node in the table containing information on added keys, select the key that you want to remove.
3. In the context menu of the line containing information on the selected key, select Remove.
4. Click the Yes button in the confirmation window to confirm that you want to delete the key.

The selected key will be removed.
Working with the Administration Plug-in

This section provides information about the Kaspersky Security for Windows Server Administration Plug-in and describes how to manage the application installed on a protected server or on a group of servers.

Managing Kaspersky Security for Windows Server from Kaspersky Security Center

You can centrally manage several servers with Kaspersky Security for Windows Server installed and included in an administration group by means of the Kaspersky Security for Windows Server Administration Plug-in. Kaspersky Security Center also lets you separately configure the operation settings of each server included in the administration group.

The administration group is created on the side of Kaspersky Security Center manually and includes several servers with Kaspersky Security for Windows Server installed, for which you want to configure the same control and protection settings. For details on using administration groups, see the Kaspersky Security Center Help.

Application settings for one computer are unavailable if the operation of Kaspersky Security for Windows Server on that server is controlled by an active Kaspersky Security Center policy.

Kaspersky Security for Windows Server can be managed from Kaspersky Security Center in the following ways:

- **Using Kaspersky Security Center policies.** Kaspersky Security Center policies can be used to remotely configure the same protection settings for a group of servers. Task settings specified in the active policy have priority over task settings configured locally in the Application Console or remotely in the Properties: <Computer name> window of Kaspersky Security Center.
  
  You can use policies to configure general application settings, Real-Time Protection task settings, Local Activity Control tasks settings, Network Attached Storage Protection task settings, scheduled system task start settings, and profile usage settings.

- **Using Kaspersky Security Center group tasks.** Kaspersky Security Center group tasks allow remote configuration of common settings of tasks with an expiration period for a group of servers.
  
  You can use group tasks to activate the application, configure On-Demand Scan task settings, update task settings, and Rule Generator for Applications Launch Control task settings.
• **Using tasks for a set of devices.** Tasks for a set of devices allow remote configuration of common task settings with a limited execution period for servers that do not belong to any one of the administration groups.

• **Using the properties window of a single computer.** In the Properties: `<Computer name>` window, you can remotely configure the task settings for a single server included in the administration group. You can configure both general application settings and settings of all Kaspersky Security for Windows Server tasks if the selected server is not controlled by an active Kaspersky Security Center policy.

Kaspersky Security Center makes it possible to configure application settings, advanced features, and lets you work with logs and notifications. You can configure these settings for a group of servers as well as for an individual server.
Managing application settings

This section contains information about configuring Kaspersky Security for Windows Server general settings in Kaspersky Security Center.

Managing Kaspersky Security for Windows Server from Kaspersky Security Center

You can centrally manage several servers with Kaspersky Security for Windows Server installed and included in an administration group by means of the Kaspersky Security for Windows Server Administration Plug-in. Kaspersky Security Center also lets you separately configure the operation settings of each server included in the administration group.

The administration group is created on the side of Kaspersky Security Center manually and includes several servers with Kaspersky Security for Windows Server installed, for which you want to configure the same control and protection settings. For details on using administration groups, see the Kaspersky Security Center Help.

Application settings for one computer are unavailable if the operation of Kaspersky Security for Windows Server on that server is controlled by an active Kaspersky Security Center policy.

Kaspersky Security for Windows Server can be managed from Kaspersky Security Center in the following ways:

- **Using Kaspersky Security Center policies.** Kaspersky Security Center policies can be used to remotely configure the same protection settings for a group of servers. Task settings specified in the active policy have priority over task settings configured locally in the Application Console or remotely in the Properties: `<Computer name>` window of Kaspersky Security Center.

  You can use policies to configure general application settings, Real-Time Protection task settings, Local Activity Control tasks settings, Network Attached Storage Protection task settings, scheduled system task start settings, and profile usage settings.

- **Using Kaspersky Security Center group tasks.** Kaspersky Security Center group tasks allow remote configuration of common settings of tasks with an expiration period for a group of servers.

  You can use group tasks to activate the application, configure On-Demand Scan task settings, update task settings, and Rule Generator for Applications Launch Control task settings.
- **Using tasks for a set of devices.** Tasks for a set of devices allow remote configuration of common task settings with a limited execution period for servers that do not belong to any one of the administration groups.

- **Using the properties window of a single computer.** In the Properties: <Computer name> window, you can remotely configure the task settings for a single server included in the administration group. You can configure both general application settings and settings of all Kaspersky Security for Windows Server tasks if the selected server is not controlled by an active Kaspersky Security Center policy.

Kaspersky Security Center makes it possible to configure application settings, advanced features, and lets you work with logs and notifications. You can configure these settings for a group of servers as well as for an individual server.

### Navigation

Learn how to navigate to the required task settings via the interface.

#### In this section

- Opening the general settings via the policy ................................................................. 97
- Opening the general settings in the application properties window ............................. 97

### Opening the general settings via the policy

*To open the application settings of the Kaspersky Security for Windows Server via the policy:*

1. Expand the Managed devices node in the Kaspersky Security Center Administration Console tree.
2. Select the administration group for which you want to configure the task.
3. Select the Policies tab.
4. Double-click the policy name you want to configure.
5. In the Properties: <Policy name> window that opens, select the Application settings section.
6. Click the Settings button in the subsection of the setting, that you want to configure.

### Opening the general settings in the application properties window

*To open the properties window of the Kaspersky Security for Windows Server for a single server:*

1. Expand the Managed devices node in the Kaspersky Security Center Administration Console tree.
2. Select the administration group for which you want to configure the task.
3. Select the Devices tab.
4. Open the Properties: <Server name> window in one of the following ways:
   - Double-click the name of the protected server.
   - Select the Properties item in the context menu of the protected server.
   The Properties: <Server name> window opens.
5. In the Applications section, select the Kaspersky Security for Windows Server.
6. Click the Properties button.
   The "Kaspersky Security for Windows Server" application settings window opens.
7. Select the Application settings section.

Configuring general application settings in Kaspersky Security Center

You can configure general Kaspersky Security for Windows Server settings from Kaspersky Security Center for a group of servers or for one server.

In this section

- Configuring scalability and the interface in Kaspersky Security Center .............................................. 98
- Configuring security settings in Kaspersky Security Center ........................................................................ 99
- Configuring connection settings using Kaspersky Security Center ........................................................... 101
- Configuring scheduled start of local system tasks ....................................................................................... 102

Configuring scalability and the interface in Kaspersky Security Center

To configure scalability settings and the application interface:

1. Expand the Managed devices node in the Kaspersky Security Center Administration Console tree.
2. Select the administration group for which you want to configure application settings.
3. Perform one of the following actions in the details pane of the selected administration group:
   - To configure application settings for a group of servers, select the Policies tab and open the Properties: <Policy name> window (see Section "Configuring policy" on page 119).
   - To configure the application for a single server, select the Devices tab and open the Application settings window (see Section "Configuring local tasks in the Application settings window of the Kaspersky Security Center" on page 124).

If an active Kaspersky Security Center policy is applied to a device, and this policy blocks changes to application settings, then these settings cannot be edited in the Application settings window.

4. In the Application settings section, in the Scalability and interface block, click Settings.
5. In the Advanced application settings window on the General tab, configure the following settings:
   - In the Scalability settings section, configure the settings that define the number of processes used by Kaspersky Security for Windows Server:
• **Automatically detect scalability settings.**
  Kaspersky Security for Windows Server automatically regulates the number of processes used.
  This is the default value.

• **Set the number of working processes manually.**
  Kaspersky Security for Windows Server regulates the number of active working processes according to the values specified.

  • **Maximum number of active processes.**
    Maximum number of processes that Kaspersky Security for Windows Server uses. The entry field is available if the **Set the number of working processes manually** option is selected.

  • **Number of processes for real-time protection.**
    Maximum number of processes that are used by the Real-Time Protection task components. The entry field is available if the **Set the number of working processes manually** option is selected.

  • **Number of processes for background on-demand scan tasks.**
    Maximum number of processes used by the On-Demand Scan component when running On-Demand Scan tasks in background mode. The entry field is available if the **Set the number of working processes manually** option is selected.

  • In the **Interaction with user** section, configure the display of the application System Tray Icon in the notification area: clear or select the **Display System Tray Icon in the taskbar** check box.

6. On the **Hierarchical storage** tab, select the option for accessing the hierarchical storage (see Section "Configuring HSM system settings via the Administration Plug-in" on page 516).

7. Click **OK**.

The configured application settings are saved.

**Configuring security settings in Kaspersky Security Center**

► To configure security settings manually, take the following steps:

1. Expand the **Managed devices** node in the Kaspersky Security Center Administration Console tree.

2. Select the administration group for which you want to configure application settings.

3. Perform one of the following actions in the details pane of the selected administration group:

   • To configure application settings for a group of servers, select the **Policies** tab and open the **Properties: <Policy name>** window (see Section "Configuring policy" on page 119).

   • To configure the application for a single server, select the **Devices** tab and open the **Application settings** window (see Section "Configuring local tasks in the Application settings window of the Kaspersky Security Center" on page 124).

---

If an active Kaspersky Security Center policy is applied to a device, and this policy blocks changes to application settings, then these settings cannot be edited in the **Application settings** window.
4. In the **Application settings** section, click the **Settings** button under the **Security** settings.

5. In the **Security settings** window, configure the following settings:

   - In the **Reliability settings** section, configure the settings for recovery of Kaspersky Security for Windows Server tasks when the application returns an error or terminates.
     
     **Perform task recovery**
     
     This check box enables or disables the recovery of Kaspersky Security for Windows Server tasks when the application returns an error or terminates.
     
     If the check box is selected, Kaspersky Security for Windows Server automatically recovers Kaspersky Security for Windows Server tasks when the application returns an error or terminates.
     
     If the check box is cleared, Kaspersky Security for Windows Server does not recover Kaspersky Security for Windows Server tasks when the application returns an error or terminates.
     
     The check box is selected by default.

   - **Recover on-demand scan tasks no more than (times)**
     
     The number of attempts to recover an On-Demand Scan task after Kaspersky Security for Windows Server returns an error. The entry field is available if the **Perform task recovery** check box is selected.

   - In the **Actions when switching to UPS backup power** section, specify limitations on server load created by Kaspersky Security for Windows Server after switching to UPS power:
     
     **Do not start scheduled scan tasks**
     
     This check box enables or disables the start of a scheduled scan task after the server switches to a UPS source until the standard power supply mode is restored.
     
     If the check box is selected, Kaspersky Security for Windows Server does not start scheduled scan tasks after the server switches to a UPS source until the standard power supply mode is restored.
     
     If the check box is cleared, Kaspersky Security for Windows Server starts scheduled scan tasks regardless of the power supply mode.
     
     The check box is selected by default.

     **Stop current scan tasks**
     
     The check box enables or disables the execution of running scan tasks after the server switches to a UPS source.
     
     If the check box is selected, Kaspersky Security for Windows Server pauses running scan tasks after the server switches to a UPS source.
     
     If the check box is cleared, Kaspersky Security for Windows Server continues running scan tasks after the server switches to a UPS source.
     
     The check box is selected by default.

   - In the **Password protection settings** section, set a password to protect access to Kaspersky Security for Windows Server functions.

6. Click **OK**.

   The scalability and reliability settings are saved.
Configuring connection settings using Kaspersky Security Center

The configured connection settings are used to connect Kaspersky Security for Windows Server to update and activation servers and during integration of applications with KSN services.

► To configure the connection settings take the following steps:

1. Expand the **Managed devices** node in the Kaspersky Security Center Administration Console tree.
2. Select the administration group for which you want to configure application settings.
3. Perform one of the following actions in the details pane of the selected administration group:
   - To configure application settings for a group of servers, select the **Policies** tab and open the Properties: <Policy name> window (see Section "Configuring policy" on page 119).
   - To configure the application for a single server, select the **Devices** tab and open the Application settings window (see Section "Configuring local tasks in the Application settings window of the Kaspersky Security Center" on page 124).

   **If an active Kaspersky Security Center policy is applied to a device, and this policy blocks changes to application settings, then these settings cannot be edited in the Application settings window.**

4. In the **Application settings** section click the **Settings** button in the **Connections** block.
   The **Connection settings** window opens.
5. In the **Connection settings** window, configure the following settings:
   - In the **Proxy server settings** section, select the proxy server usage settings:
     - **Do not use proxy server.**
       If this option is selected, Kaspersky Security for Windows Server connects to KSN services directly, without using any proxy server.
     - **Use specified proxy server settings.**
       If this option is selected, Kaspersky Security for Windows Server connects to KSN using proxy server settings specified manually.
     - **IP address or the symbol name of the proxy server and the port number.**
     - **Do not use proxy server for local addresses.**
       The check box enables or disables the use of a proxy server when accessing computers located in the same network as the computer with Kaspersky Security for Windows Server installed.
       If this check box is selected, computers are accessed directly from the network, which hosts the computer with Kaspersky Security for Windows Server installed. No proxy server is used.
       If the check box is cleared, the proxy server is applied to connect to local computers.
       The check box is selected by default.
In the **Proxy server authentication settings** section, specify the authentication settings:

- Select the authentication settings in the drop-down list.
  - **Do not use authentication** – authentication is not performed. This mode is selected by default.
  - **Use NTLM authentication** – authentication is performed using the NTLM network authentication protocol developed by Microsoft.
  - **Use NTLM authentication with user name and password** – authentication is performed using the name and password through the NTLM network authentication protocol developed by Microsoft.
  - **Apply user name and password** – authentication is performed using the user name and password.
- Enter user name and password, if needed.
- In the **Licensing** block clear or select the **Use Kaspersky Security Center as a proxy server when activating the application**.

6. Click **OK**.

The configured connection settings are saved.

### Configuring scheduled start of local system tasks

You can use policies to allow or block start of the local system On-Demand Scan task and the Update task according to the following schedule configured locally on each server in the administration group:

- If the scheduled start of a specific type of local system task is prohibited by a policy, these tasks will not be performed on the local computer as per the schedule. You can start the local system tasks manually.
- If the scheduled start of a specific type of local system task is allowed by a policy, these tasks will be performed in accordance with the scheduled parameters configured locally for this task.

By default, start of local system tasks is prohibited by policy.

**We recommend that you do not allow local system tasks to start if updates or on-demand scans are being administered by Kaspersky Security Center group tasks.**

If you do not use group update or on-demand scan tasks, allow local system tasks to be started in the policy: Kaspersky Security for Windows Server will perform application database and module updates, and start all local system on-demand scan tasks in accordance with the default schedule.

You can use policies to allow or block the scheduled start of the following local system tasks:

- **On-Demand Scan tasks**: Critical Areas Scan, Quarantine Scan, Scan at Operating System Startup, Application Integrity Control.
- **Update tasks**: Database Update, Software Modules Update and Copying Updates.

**If the protected server is excluded from the administration group, the system tasks schedule will be enabled automatically.**
To allow or block the scheduled start of Kaspersky Security for Windows Server system tasks in a policy take the following steps:

1. In the Managed devices node in the Administration Console tree, expand the required group and select the Policies tab.
2. On the Policies tab in the context menu of the policy with which you want to configure the scheduled start of Kaspersky Security for Windows Server system tasks on the group of servers, select the Properties item.
3. In the Properties: <Policy name> window, open the Application settings section. In the Run system tasks section, click the Settings button and perform the following:
   - Select the Allow on-demand scan tasks launch and Allow update tasks and Copying Update task launch check boxes to allow the scheduled launch of the listed tasks.
   - Clear the Allow on-demand scan tasks launch and Allow update tasks and Copying Update task launch check boxes to disable the scheduled launch of the listed tasks.

   Selecting or clearing the check box will not affect the start settings of any local custom tasks of this type.
4. Make certain that the policy you are configuring is active and applied to the selected group of servers.
5. Click OK.

The configured scheduled task start settings are applied for the selected tasks.

Configuring Quarantine and Backup settings in Kaspersky Security Center

To configure general Backup settings in Kaspersky Security Center:

1. Expand the Managed devices node in the Kaspersky Security Center Administration Console tree.
2. Select the administration group for which you want to configure application settings.
3. Perform one of the following actions in the details pane of the selected administration group:
   - To configure application settings for a group of servers, select the Policies tab and open the Properties: <Policy name> window (see Section “Configuring policy” on page 119).
   - To configure the application for a single server, select the Devices tab and open the Application settings window (see Section "Configuring local tasks in the Application settings window of the Kaspersky Security Center" on page 124).

   If an active Kaspersky Security Center policy is applied to a device, and this policy blocks changes to application settings, then these settings cannot be edited in the Application settings window.
4. In the Supplementary section, click the Settings button in the Storages subsection.
5. Use the **Backup** tab of the **Storages** settings window to configure the following Backup settings:

   - To specify the backup folder, use the **Backup folder** field to select the required folder on the local drive of the protected server, or enter its full path.
   - To set the maximum size of Backup, select the **Maximum Backup size (MB)** check box and specify the relevant value in megabytes in the entry field.
   - To set the threshold of free space in Backup, define the value of the **Maximum Backup size (MB)** setting, select the **Threshold value for space available (MB)** check box, and specify the minimum value of free space in the Backup folder in megabytes.
   - To specify a folder for restored objects, select the relevant folder on a local drive of the protected server in the **Restoration settings** section, or enter the name of the folder and the full path to it in the **Target folder for restoring objects** field.

6. In the **Storages** settings window on the **Quarantine** tab, configure the following Quarantine settings:

   - To change the quarantine folder, in the **Quarantine folder** entry field specify the complete path to the folder on the local drive of the protected server.
   - To set the maximum Quarantine size, select the **Maximum Quarantine size (MB)** check box and specify the value of this parameter in megabytes in the entry field.
   - To set the minimum amount of free space in Quarantine, select the **Maximum Quarantine size (MB)** check box and the **Threshold value for space available (MB)** check box, and then specify the value of this parameter in megabytes in the entry field.
   - To change the folder to which objects are restored from Quarantine, in the **Target folder for restoring objects** entry field specify the complete path to the folder on the local drive of the protected server.

7. Click **OK**.
   The configured Quarantine and Backup settings are saved.

### Blocking access to network resources. Blocked Hosts

This section describes how to block the untrusted computers and configure the Blocked Hosts storage settings.

**In this section**

<table>
<thead>
<tr>
<th>About the Blocked Hosts storage</th>
<th>104</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configuring Blocked Hosts settings</td>
<td>105</td>
</tr>
</tbody>
</table>

### About the Blocked Hosts storage

The Blocked Hosts storage is installed by default if any of the following components is installed: Real-Time File Protection, Anti-Cryptor for NetApp, Anti-Cryptor. These components discover remote hosts’ attempts to encrypt, open or execute objects on the protected server or network attached storage shared folders in accordance with the list of blocked hosts. Information about blocked hosts from all protected servers is sent to the Kaspersky Security Center. Kaspersky Security for Windows Server blocks access to server shared folders or network attached storage folders for all remote hosts in the list of blocked hosts.
The Blocked Hosts storage is populated, when at least one of the following tasks is started in an active mode; at that, the specified conditions are met:

- For the Real-Time File Protection task: malicious activity by a computer accessing network file resources is detected and in the Real-Time File Protection task settings the Block access to network shared resources for the hosts that show malicious activity check box is selected.
- For the Anti-Cryptor task: malicious encryption by a computer accessing network file resources is detected.
- For the Anti-Cryptor for NetApp task: an attack on the network attached storage is detected.

After the malicious activity or encryption attempt is detected, the task sends information about the attacking host to the Blocked Hosts storage and the application creates a warning event for the host blocking. Any attempts to access the protected shared network folders performed from this host will be blocked.

If the locally unique identifier (LUID) of an attacking host was added to the list of blocked hosts, Kaspersky Security for Windows Server determines the IP address of this host and adds this IP address to the list of blocked hosts instead of the LUID of the attacking host.

By default Kaspersky Security for Windows Server removes blocked hosts from the list in 30 minutes since they were added to the list. Computers’ access to network file resources is restored automatically after they are deleted from the list of blocked hosts. You can specify the period of time after which blocked hosts are automatically unblocked.

Note, that when you restrict access for managing storages for any user account, the Blocked Hosts storage will still be available. The Blocked Hosts settings cannot be changed, only if selected user account does not have Edit permissions for managing Kaspersky Security for Windows Server.

Configuring Blocked Hosts settings

► To configure the Blocked Hosts storage:

1. Expand the Managed devices node in the Kaspersky Security Center Administration Console tree.
2. Select the administration group for which you want to configure application settings.
3. Perform one of the following actions in the details pane of the selected administration group:
   - To configure application settings for a group of servers, select the Policies tab and open the Properties: <Policy name> window (see Section "Configuring policy" on page 119).
   - To configure the application for a single server, select the Devices tab and open the Application settings window (see Section "Configuring local tasks in the Application settings window of the Kaspersky Security Center” on page 124).

   ! If an active Kaspersky Security Center policy is applied to a device, and this policy blocks changes to application settings, then these settings cannot be edited in the Application settings window.

4. In the Supplementary section, click the Settings button in the Storages subsection.

   The Storages settings window is displayed.
5. In the Host blocking term section of the Blocked host storage tab, specify the number of days, hours and minutes after which blocked hosts regain access to network file resources after being blocked.

6. Click OK.

Configuring logs and notifications

The Kaspersky Security Center Administration Console can be used to configure notifications for administrator and users about the following events related to Kaspersky Security for Windows Server and the status of Anti-Virus protection on the protected server:

- The administrator can receive information about events of selected types;
- LAN users who access the protected server and terminal server users can receive information about events of the Object detected type.

Notifications about Kaspersky Security for Windows Server events can be configured either for a single computer using the Properties: <Computer name> window of the selected computer, or for a group of computers in the Properties: <Policy name> window of the selected administration group.

On the Event notifications tab or in the Notification settings window, you can configure the following types of notifications:

- Administrator notifications about events of selected types can be configured using the Event notifications tab (the standard tab of the Kaspersky Security Center application). For details on notification methods, see the Kaspersky Security Center Help.
- Both administrator and user notifications can be configured in the Notification settings window.

You can configure notifications for some events types in the window or on the tab only; you can use both the window and the tab for configuring notifications for other events types.

If you configure notifications about events of the same type using the same mode on the Event notifications tab and in the Notification settings window, the system administrator will receive notifications of those events twice but in the same mode.

Configuring log settings

To configure Kaspersky Security for Windows Server logs, perform the following steps:

1. Expand the Managed devices node in the Kaspersky Security Center Administration Console tree.
2. Select the administration group for which you want to configure application settings.
3. Perform one of the following actions in the details pane of the selected administration group:
   - To configure application settings for a group of servers, select the Policies tab and open the Properties: <Policy name> window (see Section "Configuring policy" on page 119).
   - To configure the application for a single server, select the Devices tab and open the Application settings window (see Section "Configuring local tasks in the Application settings window of the Kaspersky Security Center" on page 124).
4. In the Logs and notifications section, click the Settings button in the Task logs block.
5. In the Logs settings window define the following settings of Kaspersky Security for Windows Server according to your requirements:
   - Configure the level of detail of events in logs. To do this, perform the following actions:
     a. In the Component list select the component of Kaspersky Security for Windows Server for which you want to set the detail level.
     b. To define level of detail in the task logs and System audit log for the selected component, choose the level you need from Importance level.
   - To change the default location for logs, specify full path to the folder or click the Browse button to select it.
   - Specify how many days task logs will be stored.
   - Specify how many days information displayed in the System audit log node will be stored.
6. Click OK.
   The configured log settings are saved.

Security log

Kaspersky Security for Windows Server maintains a log of events associated with security breaches or attempted security breaches on the protected server. The following events are recorded in this log:

- Exploit Prevention events.
- Critical Log Inspection events.
- Critical events that indicate an attempted security breach (for the Real-Time Server Protection, On-Demand Scan, File Integrity Monitor, Applications Launch Control, and Device Control tasks).

You can clear the Security log as well as the System audit log (see Section "Deleting events from the system audit log" on page 208). Moreover, Kaspersky Security for Windows Server records system audit events regarding clearing the Security log.
Configuring SIEM integration settings

To reduce the load on low-performance devices and to reduce the risk of system degradation as a result of increased volumes of application logs, you can configure the publication of audit events and task performance events to the syslog server via the Syslog protocol.

A syslog server is an external server for aggregating events (SIEM). It collects and analyzes received events and also performs other actions for managing logs.

You can use SIEM integration in two modes:

- Duplicate events on the syslog server: this mode prescribes that all task performance events whose publication is configured in the settings of logs as well as all system audit events continue to be stored on the local computer even after they are sent to SIEM.
  
  It is recommended to use this mode to maximally reduce the load on the protected server.

- Delete local copies of events: this mode prescribes that all events that are registered during application operation and published to SIEM will be deleted from the local computer.

The application never deletes local versions of the security log.

Kaspersky Security for Windows Server can convert events in application logs into formats supported by the syslog server so that those events can be transmitted and successfully recognized by SIEM. The application supports conversion into structured data format and into JSON format.

To reduce the risk of unsuccessful transmission of events to SIEM, you can define the settings for connecting to the mirror syslog server.

A mirror syslog server is an additional syslog server to which the application switches automatically if the connection to the main syslog server is unavailable or if the main server cannot be used.

By default, SIEM integration is not used. You can enable and disable SIEM integration, and configure functionality settings (see the table below).

<table>
<thead>

<td>You can use the appropriate fields to configure the IP address and port used to connect to the main syslog server. You can specify the IP address only in IPv4 format.</td>
</tr>
<tr>
<td>Use mirror syslog server if the main server is not accessible</td>
<td>Not applied</td>
<td>You can use the check box to enable or disable the use of a mirror syslog server.</td>
</tr>
<tr>
<td>Mirror syslog server connection settings</td>
<td>IP address: 127.0.0.1 Port: 514</td>
<td>You can use the appropriate fields to configure the IP address and port used to connect to the mirror syslog server. You can specify the IP address only in IPv4 format.</td>
</tr>
</tbody>
</table>

To configure SIEM integration settings:

1. Expand the Managed devices node in the Kaspersky Security Center Administration Console tree.
2. Select the administration group for which you want to configure application settings.
3. Perform one of the following actions in the details pane of the selected administration group:
   - To configure application settings for a group of servers, select the Policies tab and open the Properties: <Policy name> window (see Section "Configuring policy" on page 119).
   - To configure the application for a single server, select the Devices tab and open the Application settings window (see Section "Configuring local tasks in the Application settings window of the Kaspersky Security Center" on page 124).

   If an active Kaspersky Security Center policy is applied to a device, and this policy blocks changes to application settings, then these settings cannot be edited in the Application settings window.

4. In the Logs and notifications section click the Settings button in the Task logs block. The Logs and notifications settings window opens.
5. Select the SIEM integration tab.
6. In the Integration settings section, select the Send events to a remote syslog server via syslog protocol check box.

   The check box enables or disables the functionality for sending published events to an external syslog server.
   - If the check box is selected, the application sends published events to SIEM according to the configured SIEM integration settings.
   - If the check box is cleared, the application does not perform SIEM integration. You cannot configure SIEM integration settings if the check box is cleared.

   The check box is cleared by default.
7. If necessary, in the Integration settings section, select the Remove local copies for events that have been sent to a remote syslog server check box.

The check box enables or disables deletion of local copies of logs when they are sent to SIEM.

If the check box is selected, the application deletes the local copies of events after they have been successfully published to SIEM. This mode is recommended on low-performance computers.

If the check box is cleared, the application only sends events to SIEM. Copies of logs continue to be stored locally.

The check box is cleared by default.

The status of the Remove local copies for events that have been sent to a remote syslog server check box does not affect the settings for storing events of the security log: the application never automatically deletes security log events.

8. In the Events format section, specify the format to which you want to convert application operation events so that they can be sent to SIEM.

By default, the application converts them into structured data format.

9. In the Connection settings section:

- Specify the SIEM connection protocol.
- Specify the settings for connecting to the main syslog server.
  
  You can specify an IP address in IPv4 format only.
- Select the Use mirror syslog server if the main server is not accessible check box if you want the application to use other connection settings when unable to send events to the main syslog server.
  
  Specify the following settings for connecting to the mirror syslog server: IP address and Port.
  
  The IP address and Port fields for the mirror syslog server cannot be edited if the Use mirror syslog server if the main server is not accessible check box is cleared.
  
  You can specify an IP address in IPv4 format only.

10. Click OK.

The configured SIEM integration settings will be applied.

Configuring notification settings

To configure Kaspersky Security for Windows Server notifications, perform the following steps:

1. Expand the Managed devices node in the Kaspersky Security Center Administration Console tree.
2. Select the administration group for which you want to configure application settings.
3. Perform one of the following actions in the details pane of the selected administration group:
   
   - To configure application settings for a group of servers, select the Policies tab and open the Properties: <Policy name> window (see Section "Configuring policy" on page 119).
To configure the application for a single server, select the **Devices** tab and open the **Application settings** window (see Section "Configuring local tasks in the Application settings window of the Kaspersky Security Center" on page 124).

If an active Kaspersky Security Center policy is applied to a device, and this policy blocks changes to application settings, then these settings cannot be edited in the **Application settings** window.

4. In the **Logs and notifications** section, click the **Settings** button in the **Event notifications** subsection.

5. In the **Notification settings** window, define the following settings of Kaspersky Security for Windows Server according to your requirements:
   - In the **Notification settings** list select the type of notification whose settings you want to configure.
   - In the **Notify users** section configure the user notification method. If necessary, enter the text of the notification message.
   - In the **Notify administrators** section configure the administrator notification method. If necessary, enter the text of the notification message. If necessary, configure additional notification settings by clicking the **Settings** button.
   - In the **Event generation thresholds** section, specify the time intervals after which Kaspersky Security for Windows Server logs the events Application database is out of date, Application database is extremely out of date and Critical Areas Scan has not been performed for a long time.
     - **Application database is out of date (days)**
       The number of days that have passed since the last Database Update. The default value is 7 days.
     - **Application database is extremely out of date (days)**
       The number of days that have passed since the last Database Update. The default value is 14 days.
     - **Critical Areas Scan has not been performed for a long time (days)**
       The number of days after the last successful Critical Areas Scan. The default value is 30 days.

6. Click **OK**.

   The configured notification settings are saved.

### Configuring interaction with the Administration Server

To select the types of objects about which Kaspersky Security for Windows Server sends information to the Kaspersky Security Center Administration Server:

1. Expand the **Managed devices** node in the Kaspersky Security Center Administration Console tree.
2. Select the administration group for which you want to configure application settings.
3. Perform one of the following actions in the details pane of the selected administration group:
   - To configure application settings for a group of servers, select the **Policies** tab and open the **Properties: <Policy name>** window (see Section "Configuring policy" on page 119).
To configure the application for a single server, select the Devices tab and open the Application settings window (see Section "Configuring local tasks in the Application settings window of the Kaspersky Security Center" on page 124).

If an active Kaspersky Security Center policy is applied to a device, and this policy blocks changes to application settings, then these settings cannot be edited in the Application settings window.

4. In the Logs and notifications section, click the Settings button in the Interaction with Administration Server block.

The Administration Server Network lists window opens.

5. In the Administration Server Network lists window, select the types of objects about which Kaspersky Security for Windows Server will send information to the Kaspersky Security Center Administration Server:

- Quarantined objects.
- Backed up objects.
- Blocked hosts.

6. Click OK.

Kaspersky Security for Windows Server will send information about the selected object types to the Administration Server.
Creating and configuring policies

This section provides information on using Kaspersky Security Center policies for managing Kaspersky Security for Windows Server on several servers.

Global Kaspersky Security Center policies can be created for managing protection on several servers where Kaspersky Security for Windows Server is installed.

A policy enforces the Kaspersky Security for Windows Server settings, functions and tasks specified in it on all the protected servers for one administration group.

Several policies for one administration group can be created and enforced in turns. The policy currently active for a group has the active status in Administration Console.

Information on policy enforcement is logged in the Kaspersky Security for Windows Server system audit log. This information can be viewed in the Application Console in the System audit log node.

Kaspersky Security Center offers one way to apply policies on local computers: Prohibit changing the settings. After a policy has been applied, Kaspersky Security for Windows Server uses the values for settings next to which you have selected the icon in the policy properties on local computers instead of the values for those settings that had been actual before the policy was applied. Kaspersky Security for Windows Server does not apply the values of active policy settings next to which the icon is selected in the policy properties.

If a policy is active, the values of settings marked with the icon in the policy are displayed in the Application Console but cannot be edited. The values of other settings (marked with the icon in the policy) can be edited in the Application Console.

The settings configured in the active policy and marked with the icon also block changes in Kaspersky Security Center for one computer in the Properties: <Computer name> window.

The settings, that are specified and sent to the local computer using an active policy, are saved in the local tasks settings after the active policy is disabled.

If the policy defines the settings for any Real-Time Server Protection task or Network Attached Storage Protection task, and if such a task is currently running, then the settings defined by the policy will be modified as soon as the policy is applied. If the task is not running, the settings are applied when it starts.

In this chapter

| Creating policy .................................................................................................................................................. 114 |
| Kaspersky Security for Windows Server policy settings sections ........................................................................ 115 |
| Configuring policy .......................................................................................................................................... 119 |
Creating policy

The process of creating a policy involves the following steps:

1. Creating a policy using the policy wizard. Real-Time Server Protection tasks settings can be configured using the wizard dialogs.

2. Configuring policy settings. In the Properties: <Policy name> window of the created policy, you can define the Real-Time Server Protection tasks settings, the general settings of Kaspersky Security for Windows Server, the Quarantine and Backup settings, the level of detail for task logs, as well as user and administrator notifications about Kaspersky Security for Windows Server events.

To create a policy for a group of servers running the installed Kaspersky Security for Windows Server, take the following steps:

1. Expand the Managed devices node in the Kaspersky Security Center Administration Console tree, then select the administration group containing the servers for which you wish to create a policy.

2. In the details pane of the selected administration group, select the Policies tab and click the Create a policy link to start the wizard and create a policy.

   The New Policy Wizard window opens.

3. In the Select the application for which you want to create a group policy window, select Kaspersky Security for Windows Server and click Next.

4. Enter a group policy name in the Name field.

   The policy name cannot contain the following symbols: " * < : > ? \ | .

5. To apply policy configuration used for the previous application version:
   a. Select the Use settings from policy for previous versions of application check box.
   b. Click the Select button.
   c. Select the policy you want to apply.
   d. Click Next.

6. In the Operation type selection window, select one of the following options:
   - **New**, to create new policy with default settings.
   - **Import policy created with previous versions of Kaspersky Security for Windows Server**, to use that version policy as a template.
   - **Click Browse and select a configuration file where an existing policy is stored.**

7. In the Real-time server protection window, configure the Real-Time File Protection, KSN Usage tasks, Exploit Prevention functionality and Script Monitoring functionality as required. Allow or block the use of configured policy tasks on local computers on the network:
   - Click the button to allow changes to task settings on network computers and block the application of task settings configured in the policy.
   - Click the button to deny changes to task settings on network computers and allow the application of task settings configured in the policy.

The newly created policy uses the default settings of Real-Time Server Protection tasks.
To edit the default settings of the Real-Time File Protection task, click the Settings button in the Real-Time File Protection subsection. In the window that opens, configure the task according to your needs. Click OK.

To edit the default settings of the KSN Usage task, click the Settings button in the KSN Usage subsection. In the window that opens, configure the task according to your needs. Click OK.

To edit the default settings of the Exploit Prevention component, click the Settings button in the Exploit Prevention subsection. In the window that opens, configure the functionality according to your needs. Click OK.

To start the KSN Usage task, you need to accept the KSN Statement in the Data handling window (see Section "Configuring Data handling via the Administration Plug-in" on page 285).

To edit the default settings of the Exploit Prevention component, click the Settings button in the Exploit Prevention subsection. In the window that opens, configure the task according to your needs. Click OK.

8. Select one of the following policy statuses in the Create the group policy for the application window:

- **Active policy** if you want to apply the policy immediately after it is created. If an active policy already exists in the group, it is deactivated and a new policy is applied.
- **Inactive policy** if you do not want to apply the created policy immediately. In this case the policy may be activated later.
- Select the Open policy properties immediately after they are created check box to automatically close the New Policy Wizard and configure the newly created policy after clicking the Next button.

9. Click the Finish button.

The created policy appears in the list of policies on the Policies tab of the selected administration group. In the Properties: <Policy name> window, you can configure other settings, tasks and functions of Kaspersky Security for Windows Server.

### Kaspersky Security for Windows Server policy settings sections

#### General
In the General section, you can configure the following policy settings:

- Indicate policy status.
- Configure the inheritance of settings from parent policies and for child policies.

#### Event configuration
In the Event configuration section, you can configure settings for the following event categories:

- Critical events
- Functional failure
- Warning
- Informational message

You can use the Properties button to configure the following settings for the selected events:

- Indicate the storage location and retention period of information about logged events.
- Indicate the method of notification about logged events.
### Application settings

**Table 11. Settings of the Application Settings section**

<table>
<thead>

</thead>
</table>
| Trusted Zone                                 | Click the **Settings** button on the **Trusted Zone** subsection to configure the following Trusted Zone application settings:  
  * Create a list of Trusted Zone exclusions.  
  * Enable or disable scanning of file backup operations.  
  * Create a list of trusted processes. |
| Removable Drives Scan                        | In the **Removable Drives Scan** subsection, you can use the **Settings** button to configure scan settings for removable USB drives.                                                                 |
| User access permissions for application management | In the **User access permissions for application management** subsection, you can configure user rights and user group rights to manage Kaspersky Security for Windows Server. |
| User access permissions for Security Service management | In the **User access permissions for Security Service management** subsection, you can configure user rights and user group rights to manage the Kaspersky Security Service. |
### Storages

In the **Storages** subsection, click the **Settings** button to configure the following Quarantine, Backup and Blocked Hosts settings:

- Specify the path to the folder into which you want to place Quarantine or Backup objects.
- Configure the maximum size of Backup and Quarantine and also specify the free space threshold.
- Specify the path to the folder into which you want to place objects restored from Quarantine or Backup.
- Configure the host blocking term.

To review the detailed information about Network Attached Storage Protection tasks, see the Kaspersky Security for Windows Server Implementation Guide for Network Storages Protection.

Revision history

In the Revision history section, you can manage revisions: compare with the current revision or other policy, add descriptions of revisions, save revisions to a file or perform a rollback.

Configuring policy

In the Properties: <Policy name> window of an existing policy, you can configure general Kaspersky Security for Windows Server settings, quarantine and backup settings, Trusted Zone settings, Real-Time Server Protection settings, Local Activity Control settings, the level of detail for task logs, as well as user and administrator notifications about the Kaspersky Security for Windows Server events, access privileges for managing the application and the Kaspersky Security Service, and policy profile application settings.

► To configure the policy settings:

1. Expand the Managed devices node in the tree of the Administration Console of Kaspersky Security Center.
2. Expand the administration group, for which you want to configure the associated policy settings, and open the Policies tab in the details pane.
3. Select a policy you want to configure and open the **Properties: <Policy name>** window using one of the following ways:
   - By selecting the **Properties** option in the policy context menu.
   - By clicking the **Configure policy** link in the right details pane of the selected policy.
   - By double-clicking the selected policy.

4. On the **General** tab in the **Policy status** section, enable or disable the policy. To do so, select one of the options below:
   - **Active policy**, if you want the policy to be applied on all servers within the selected administration group.
   - **Inactive policy**, if you want to activate the policy later on all servers within the selected administration group.

The **Out-of-office policy** setting is not available when you manage Kaspersky Security for Windows Server.

5. In the **Event notification**, **Application settings**, **Supplementary**, **Logs and notifications**, and **Revision history** sections, you can modify the application configuration (see table below).

6. In the **Real-Time Server Protection**, **Local activity control**, **Network activity control** and **System inspection** sections, configure the application settings and application launch settings (see the table below).

You can enable or disable the execution of any task on all servers within the administration group by means of a Kaspersky Security Center policy.

You can configure the application of policy settings on all network computers for each individual software component.

7. Click **OK**.

The configured settings are applied in the policy.
Creating and configuring tasks using Kaspersky Security Center

This section contains information about Kaspersky Security for Windows Server tasks, and how to create them, configure task settings, and start and stop them.

About task creation in Kaspersky Security Center

You can create group tasks for administration groups and sets of computers. You can create the following task types:

- Activation of the application
- Copying Updates
- Database Update
- Software Modules Update
- Rollback of Database Update
- On-Demand Scan
- Application Integrity Control
- Rule Generator for Applications Launch Control
- Rule Generator for Device Control

You can create local and group tasks in the following ways:

- for one computer: in the Properties <Computer name> window in the Tasks section.
- for an administration group: in the details pane of the node of the selected group of computers on the Tasks tab.
- for a set of computers: in the details pane of the Device selections node.
Creating task using Kaspersky Security Center

To create a new task in the Kaspersky Security Center Administration Console:

1. Start the task wizard in one of the following ways:
   - To create a local task:
     a. Expand the Managed devices node in the tree of the Administration Console and select the group that the protected server belongs to.
     b. In the details pane, on the Devices tab open the context menu of the protected server and select Properties.
     c. In the window that opens, click the Add button in the Tasks section.
   - To create a group task:
     a. Expand the Managed devices node in the Kaspersky Security Center Administration Console tree.
     b. Select the administration group for which you want to create a task.
     c. In the details pane, open the Tasks tab and select Create a task.
   - To create a task for a custom set of servers, in the Device selections node in the Kaspersky Security Center Administration Console tree, select a device, and then from the Perform action drop-down list select Create a task option for the selected device.

The task wizard window opens.

2. In the Select the task type window under the heading Kaspersky Security for Windows Server, select the type of the task to be created.

3. If you selected any task type except Rollback of Database Update, Application Integrity Control or Activation of Application, the Settings window opens. Depending on the task type, the settings may vary:
   - Create an On-Demand Scan task (see Section "Creating an On-Demand Scan task" on page 462).
   - To create an update task, configure task settings based on your requirements:
     a. Select updates source in the Update source window.
     b. Click the Connection settings button. The Connection settings window opens.
     c. On the Connection settings window:
        Specify the FTP server mode for connecting to the protected server.
        Modify the connection timeout when connecting to the update source, if required.
        Configure proxy server access settings when connecting to the update source.
        Specify protected server(s) location, to optimize update downloads.
To create a Software Modules Update task, configure the required program modules update settings in the Settings for application software module updates window:

a. Select either to copy and install critical software module updates, or only to check for their availability without installation.

b. If Copy and install critical software modules updates is selected: a server restart may be required to apply the installed software modules. If you wish Kaspersky Security for Windows Server to restart the server automatically upon task completion, select the Allow operating system restart check box.

c. To obtain information about Kaspersky Security for Windows Server module upgrades, select Receive information about available scheduled software modules updates.

Kaspersky Lab does not publish planned update packages on the update servers for automatic installation; these can be downloaded manually from the Kaspersky Lab website. An administrator notification about the event New scheduled software modules update is available can be configured. This will contain the URL of our website from which scheduled updates can be downloaded.

To create the Copying Updates task, specify the set of updates and the destination folder in the Copying updates settings window.

To create the Activation of Application task:

a. In the Activation Settings window, apply the key file or activation code that you want to use to activate the application.

b. Select the Use as additional key check box if you want to create a task for renewing the license.

Create the Rule Generator for Applications Launch Control task (see Section "Creating a Rule Generator for Applications Launch Control task" on page 370).

Create the Rule Generator for Device Control task (see Section "Creating rules using the Rule Generator for Device Control task" on page 408).

4. Configure the task schedule (see Section "Configuring the task start schedule settings" on page 134) (you can configure a schedule for all task types except Rollback of Database Update task).

5. Click OK.

6. If the task created for a set of servers, select the network (or group) of servers on which this task will be executed.

7. In the Selecting an account to run the task window, specify the account under which you want to run the task.

8. In the Define the task name window, enter the task name (no longer than 100 characters) not containing the symbols " * < > ? \ : .

   It is recommended that the task type is added to its name (for example, "On-demand scan of shared folders").

9. In the Finishing creating the task window, select the Run task after Wizard finishes check box if you want the task to be started as soon as it has been created. Click the Finish button.

The task created is displayed in the Tasks list.
Configuring local tasks in the Application settings window of the Kaspersky Security Center

To configure local tasks or general application settings in the Application settings window for a single network server:

1. Expand the Managed devices node in the tree of the Administration Server of Kaspersky Security Center and select the group that the protected server belongs to.
2. In the details pane, select the Devices tab.
3. Open the Properties: <Computer name> window in one of the following ways:
   - Double-click the name of the protected server.
   - Open the context menu of the protected server name and select the Properties item.
   The Properties: <Computer name> window opens.
4. To configure the local task settings perform the following steps:
   a. Go to the Tasks section.
      - In the task list, select a local task to configure.
      - Double-click the task name in the list of tasks.
      - Select the task name and click the Properties button.
      - Select Properties in the context menu of the selected task.
5. To configure the application settings perform the following steps:
   a. Go to the Applications section.
      - In the installed applications list, select an application to configure.
      - Double-click the application name in the list of installed applications.
      - Select the application name in the list of installed applications and click the Properties button.
      - Open the context menu of the application name in the list of installed applications and select the Properties item.

If the application is currently under the Kaspersky Security Center policy and this policy prohibits changing the application settings, these settings cannot be edited via the Application settings window.

Configuring group tasks in Kaspersky Security Center

To configure group task for multiple servers:

1. In the Kaspersky Security Center Administration Console tree expand the Managed devices node and select the administration group for which you want to configure the application tasks.
2. On the details pane of a selected administration group, open Tasks tab.
3. In the list of previously created group tasks, select a task you want to configure. Open the Properties: <Task name> window in one of the following ways:
Working with the Administration Plug-in

- Double-click the name of the task in the list of created tasks.
- Select the name of the task in the list of created tasks and click **Configure task** link.
- Open the context menu of the task name in the list of created tasks and select the **Properties** item.

4. In the **Notification** section, configure the task event notification settings.

5. Depending on the type of configured task, do one of the following actions:
   - To configure an On-Demand Scan task:
     a. In the **Scan scope** section, configure a scan scope.
     b. In the **Options** section, configure task priority level and integration with other software components.
   - To configure an update task, adjust task settings based on your requirements:
     a. In the **Settings** section, configure update source settings and disk subsystem usage optimization.
     b. Click the **Connection settings** button to configure update source connection settings.
   - To configure Software Modules Update task, in the **Settings for application software module updates** section choose an action to perform: copy and install critical updates of software modules or only check for them.
   - To configure the Copying Updates task, specify the set of updates and the destination folder in the **Copying updates settings** section.
   - To configure the Activation of Application task, in the **Activation Settings** section apply the key file or activation code that you want to use to activate the application. Select the **Use as additional key** check box if you want to add an activation code or key file for renewing the license.
   - To configure the automatic generation of allowing rules for server control, in the **Settings** section specify the settings based on which the list of allowing rules will be created.

6. Configure the task schedule in the **Schedule** section (you can configure a schedule for all task types except Rollback of Database Update).

7. In the **Account** section specify the account which rights will be used for the task execution. For detailed information regarding configuring settings in this section, see the **Kaspersky Security Center Help**.

8. If required, specify the objects to exclude from the task scope in the **Exclusions from task scope** section. For detailed information regarding configuring settings in this section, see the **Kaspersky Security Center Help**.

9. In the **Properties: <Task name>** window, click **OK**.

The newly configured group tasks settings are saved.

Group tasks settings that are available for configuring are summarized in the table below.
### Table 18. Kaspersky Security for Windows Server group tasks settings

<table>
<thead>
<tr>
<th>Kaspersky Security for Windows Server task types</th>
<th>Section in the Properties: &lt;Task name&gt; window</th>
<th>Task settings</th>
</tr>
</thead>
</table>
| Rule Generator for Applications Launch Control | Settings                                      | While configuring the Rule Generator for Applications Launch Control task settings you can:  
• Create allowing rules based on running applications;  
• Create allowing rules for applications from the specific folders. |
| Options | You can specify actions to perform while creating allowing rules for applications launch control:  
• Use digital certificate  
• Use digital certificate subject and thumbprint  
• If the certificate is missing, use  
• Use SHA256 hash  
• Generate rules for user or group of users  
You can configure settings for configuration files with allowing rules lists that Kaspersky Security for Windows Server creates upon the task completion. |
| Schedule | You can configure the settings of scheduled startup of the task. |
| Rule Generator for Device Control | Settings                                      | • Select the operation mode: consider system data about all mass storages that have ever been connected or consider currently connected mass storages only.  
• Configure settings for configuration files with allowing rules lists that Kaspersky Security for Windows Server creates upon the task completion. |
<p>| Schedule | You can configure the settings of scheduled startup of the task. |
| Activation of Application (see Section &quot;Activation of the Application task&quot; on page 129) | Activation Settings | To activate the application or to renew the license, you can add an activation code or a key file. |
| Schedule | You can configure the settings of scheduled startup of the task. |</p>
<table>

**Activation of the Application task**

► To configure an Activation of the Application task, take the following steps:

1. In the Kaspersky Security Center Administration Console tree expand the Managed devices node and select the administration group for which you want to configure the application tasks.

2. On the details pane of a selected administration group, open Tasks tab.

3. In the list of previously created group tasks, select a task you want to configure. Open the Properties: `<Task name>` window in one of the following ways:
   - Double-click the name of the task in the list of created tasks.
   - Select the name of the task in the list of created tasks and click Configure task link.
   - Open the context menu of the task name in the list of created tasks and select the Properties item.

4. In the Notification section, configure the task event notification settings.

   For detailed information regarding configuring settings in this section, see the Kaspersky Security Center Help.

5. In the Activation Settings section, specify the key file that you want to use to activate the application. Select the Use as additional key check box if you want to add a key to extend the license.

6. Configure the task schedule in the Schedule section (you can configure a schedule for all task types except Rollback of Database Update).

7. In the Account section specify the account which rights will be used for the task execution.

8. If required, specify the objects to exclude from the task scope in the Exclusions from task scope section.

   For detailed information regarding configuring settings in these sections, see the Kaspersky Security Center Help.

9. In the Properties: `<Task name>` window, click OK.

   The newly configured group tasks settings are saved.
Update tasks

To configure the Copying Updates, Database Update, or Software Modules Update tasks, do the following:

1. In the Kaspersky Security Center Administration Console tree expand the Managed devices node and select the administration group for which you want to configure the application tasks.
2. On the details pane of a selected administration group, open Tasks tab.
3. In the list of previously created group tasks, select a task you want to configure. Open the Properties: <Task name> window in one of the following ways:
   - Double-click the name of the task in the list of created tasks.
   - Select the name of the task in the list of created tasks and click Configure task link.
   - Open the context menu of the task name in the list of created tasks and select the Properties item.
4. In the Notification section, configure the task event notification settings.

For detailed information regarding configuring settings in this section, see the Kaspersky Security Center Help.

5. Depending on the type of configured task, do one of the following actions:
   - In the Update source section, configure update source settings and disk subsystem usage optimization.
     a. You can specify Kaspersky Security Center Administration Server or Kaspersky Lab update servers as application update source in the Update source section. You can also create a customized list of update sources: by adding custom HTTP and FTP servers or network folders manually and setting them as update sources.
        You can specify the usage of Kaspersky Lab update servers, if manually customized servers are not available.
     b. In the Disk I/O usage optimization section for the Database Update task, you can configure the feature that reduces the workload on the disk subsystem:
        - Lower the load on the disk I/O
          This check box enables or disables the feature of the disk subsystem optimization through storing update files on a virtual drive in the RAM.
          If the check box is selected, this function is enabled.
          The check box is cleared by default.
        - RAM used for optimization (MB)
          The size of the RAM (in MB) that the application uses for storing update files. The default RAM size is 512 MB. The minimum RAM size is 400 MB.
     c. Click the Connection settings button, and in the Connection settings window that opens, configure the use of a proxy server for connecting to Kaspersky Lab update servers and other servers.
   - In the Settings for application software module updates section for the Software Modules Update task, you can specify which actions Kaspersky Security for Windows Server should perform when
critical software module updates are available or information about planned updates is available, and you can also specify which actions Kaspersky Security for Windows Server should perform when critical updates are installed.

- Specify the set of updates and the destination folder in the Copying updates settings section for the Copying Updates task.

6. Configure the task schedule in the Schedule section (you can configure a schedule for all task types except Rollback of Database Update).

7. In the Account section specify the account which rights will be used for the task execution.

For detailed information regarding configuring settings in these sections, see the Kaspersky Security Center Help.

8. In the Properties: <Task name> window, click OK.

The newly configured group tasks settings are saved.

For the Rollback of Database Update task, you can configure only standard task settings controlled by Kaspersky Security Center in the Notifications and Exclusions from task scope sections. For detailed information regarding configuring the settings in these sections, see the Kaspersky Security Center Help.

Application Integrity Control

► To configure the Application Integrity Control group task:

1. In the Kaspersky Security Center Administration Console tree expand the Managed devices node and select the administration group for which you want to configure the application tasks.

2. On the details pane of a selected administration group, open Tasks tab.

3. In the list of previously created group tasks, select a task you want to configure. Open the Properties: <Task name> window in one of the following ways:
   - Double-click the name of the task in the list of created tasks.
   - Select the name of the task in the list of created tasks and click Configure task link.
   - Open the context menu of the task name in the list of created tasks and select the Properties item.

4. In the Notification section, configure the task event notification settings.

For detailed information regarding configuring settings in this section, see the Kaspersky Security Center Help.

5. In the Devices section, select the devices for which you want to configure the Application Integrity Control task.

6. Configure the task schedule in the Schedule section (you can configure a schedule for all task types except Rollback of Database Update).

7. In the Account section specify the account which rights will be used for the task execution.

8. If required, specify the objects to exclude from the task scope in the Exclusions from task scope section.
For detailed information regarding configuring settings in these sections, see the Kaspersky Security Center Help.

9. In the Properties: <Task name> window, click OK.
The newly configured group tasks settings are saved.

Configuring crash diagnostics settings in Kaspersky Security Center

If a problem occurs during Kaspersky Security for Windows Server operation (for example, Kaspersky Security for Windows Server crashes) and you want to diagnose it, you can enable the creation of trace files and the dump file of Kaspersky Security for Windows Server process and send these files for analysis to Kaspersky Lab Technical Support.

Kaspersky Security for Windows Server does not send any trace or dump files automatically. Diagnostics data can only be sent by the user with the corresponding permissions.

Kaspersky Security for Windows Server writes information to trace files and the dump file in unencrypted form. The folder where files are saved is selected by the user and managed by the operating system configuration and Kaspersky Security for Windows Server settings. You can configure access permissions (see Section "Managing access permissions for Kaspersky Security for Windows Server functions" on page 228) and allow access to logs, trace and dump files only for required users.

► To configure crash diagnostics settings in Kaspersky Security Center:

1. In the Kaspersky Security Center Administration Console, open the Application settings (see Section "Configuring local tasks in the Application settings window of the Kaspersky Security Center" on page 124) window.

2. Open the Malfunction diagnosis section and do the following:
   - If you want the application to write debug information to file, select the Write debug information to trace file check box.
   - In the field below specify the folder in which Kaspersky Security for Windows Server will save trace files.
   - Configure the level of detail of debug information.
     This drop-down list lets you select the level of detail of debug information that Kaspersky Security for Windows Server saves to the trace file.
     You can select one of the following detail levels:
     - Critical events – Kaspersky Security for Windows Server saves information only about critical events to the trace file.
     - Errors – Kaspersky Security for Windows Server saves information about critical
events and errors to the trace file.

- **Important events** – Kaspersky Security for Windows Server saves information about critical events, errors, and important events to the trace file.
- **Informational events** – Kaspersky Security for Windows Server saves information about critical events, errors, important events, and informational events to the trace file.
- **All debug information** – Kaspersky Security for Windows Server saves all debug information to the trace file.

A Technical Support representative determines the detail level that needs to be set in order to resolve the issue that arose.

The default level of detail is set to **All debug information**.

The drop-down list is available if the **Write debug information to trace file** check box is selected.

- Specify the maximum size of trace files.
- Specify the components to be debugged. Component codes must be separated with a semicolon. The codes are case sensitive (see table below).

### Table 19. Kaspersky Security for Windows Server subsystem codes

<table>
<thead>
<tr>

<td>Performance counter subsystem.</td>
</tr>
</tbody>
</table>

The trace settings of the Kaspersky Security for Windows Server snap-in (gui) and the Administration Plug-in for Kaspersky Security Center (ak_conn) are applied after these
components are restarted. The trace settings of the SNMP protocol support subsystem (snmp) are applied after the SNMP service is restarted. The trace settings of the performance counters subsystem (perfcount) are applied after all processes that use performance counters are restarted. Trace settings for other Kaspersky Security for Windows Server subsystems are applied as soon as the crash diagnostics settings are saved.

The entry field is available if the **Write debug information to trace file** check box is selected.

- If you want the application to create a dump file, select the **Create dump file** check box.
  - In the field below, specify the folder in which Kaspersky Security for Windows Server will save the dump file.

3. Click **OK**.

The configured application settings are applied on the protected server.

**Managing task schedules**

You can configure the start schedule for Kaspersky Security for Windows Server tasks, and configure settings for running tasks by schedule.

**In this section**

| Configuring the task start schedule settings | ................................................................. 134 |
| Enabling and disabling scheduled tasks | ................................................................. 136 |

**Configuring the task start schedule settings**

You can configure the start schedule for local system and custom tasks in the Application Console. You cannot configure the start schedule for group tasks.

► *To configure group task start schedule settings, do the following:*

1. In the Kaspersky Security Center Administration Console tree, expand the **Managed devices** node.
2. Select the group that the protected server belongs to.
3. In the details pane, select the **Tasks** tab.
4. Open the **Properties: <Task name>** window in one of the following ways:
   - Double-click the name of the task.
   - Open the context menu of the task name and select the Properties item.
5. Select **Schedule** section.
6. In the **Schedule settings** block, select the **Run by schedule** check box.

*Fields with the schedule settings for the On-Demand Scan and Update tasks are unavailable if their scheduled start is blocked by a policy of Kaspersky Security Center.*
7. Configure schedule settings in accordance with your requirements. To do this, perform the following actions:

a. In the **Frequency** list, select one of the following values:
   - **Hourly**, if you want the task to run at intervals of a specified number of hours; specify the number of hours in the **Every <number> hour(s)** field.
   - **Daily**, if you want the task to run at intervals of a specified number of days; specify the number of days in the **Every <number> day(s)** field.
   - **Weekly**, if you want the task to run at intervals of a specified number of weeks; specify the number of weeks in the **Every <number> week(s)** field. Specify the days of the week on which the task will be started (by default the task runs on Mondays).
   - **At application launch**, if you want the task to run every time Kaspersky Security for Windows Server starts.
   - **After application database update**, if you want the task to run after every update of the application databases.

b. Specify the time for the first task start in the **Start time** field.

c. In the **Start date** field, specify the date from which the schedule applies.

After you have specified the task start frequency, the time of the first task start, and the date from which the schedule applies, information about the estimated time for the next task start will appear in the top part of the window in the **Next start** field. Updated information about the estimated time of the next task start will be displayed each time you open the **Task settings** window of the **Schedule** tab. The **Blocked by policy** value is displayed in the **Next start** field if the active policy settings of Kaspersky Security Center prohibit start of scheduled system tasks (see Section "Configuring scheduled start of local system tasks" on page 102).

8. Use the **Advanced** tab to configure the following schedule settings in accordance with your requirements.

   - In the **Task stop settings** section:
     a. Select the **Duration** check box and enter the required number of hours and minutes in the fields to the right to specify the maximum duration of the task execution.
     b. Select the **Pause from** check box and enter the start and end values of the time interval in the fields to the right to specify a time interval under 24 hours during which task execution will be paused.

   - In the **Advanced settings** section:
     a. Select the **Cancel schedule from** check box and specify the date from which the schedule will cease to operate.
     b. Select the **Run skipped tasks** check box to enable the start of skipped tasks.
     c. Select the **Randomize the task start time within the interval of** check box and specify a value in minutes.
9. Click OK.

10. Click the Apply button to save the task start settings.

If you want to configure application settings for a single task using Kaspersky Security Center, perform the steps described in Configuring local tasks in the Application settings window of the Kaspersky Security Center (on page 124) section.

### Enabling and disabling scheduled tasks

You can enable and disable scheduled tasks either before or after configuring the schedule settings.

► To enable or disable the task start schedule, take the following steps:

1. In the Application Console tree open the context menu on the task name for which you wish to configure the start schedule.

2. Select Properties.

   The Task settings window opens.

3. In the window that opens on the Schedule tab, do one of the following:

   - Select the Run by schedule check box if you want to enable scheduled task start.
   - Clear the Run by schedule check box if you want to disable scheduled task start.

   The configured task start schedule settings are not deleted and will be applied at the next scheduled start of the task.

4. Click OK.

5. Click the Apply button.

   The configured task start schedule settings are saved.

### Reporting in Kaspersky Security Center

Reports in Kaspersky Security Center contain information about the status of managed devices. Reports are based on information stored on Administration Server.

Starting from the Kaspersky Security Center 11 the following types of reports are available for the Kaspersky Security for Windows Server:

- Report on the status of application components
- Report on prohibited applications
- Report on prohibited applications in test mode

See Kaspersky Security Center Help for detailed information about all Kaspersky Security Center reports and how to configure them.
Report on the application components status

You can monitor the protection status of all network devices and get a structured overview of the component set on each device.

Report displays one of the following states for each component: Running, Paused, Stopped, Malfunction, Not installed, Starting.

The Not Installed status refers to the component, not the application itself. If the application is not installed the Kaspersky Security Center assigns the N/A (Not available) status.

You can create component selections and use filtering to display network devices with the defined set of components and their state.

See Kaspersky Security Center Help for detailed information about creating and using selections.

► To review the components statuses in the application settings:

1. Expand the Managed devices node in the Kaspersky Security Center Administration Console tree and select the administration group for which you want to configure application settings.
2. Select the Devices tab and open the Application settings window (see Section “Configuring local tasks in the Application settings window of the Kaspersky Security Center” on page 124).
3. Select the Components section.
4. Review the status table.

► To review a Kaspersky Security Center standard report:

1. Select the Administration Server <computer name> node in the Administration Console tree.
2. Open the Reports tab.
3. Double-click the Report on the status of application components list item.
   A report is generated.
4. Review the following report details:
   • A graphical diagram.
   • A summary table of components and aggregated numbers of network devices where each of the components is installed, and groups they belong to.
   • A detailed table specifying component status, version, device and group.

Reports on blocked applications in active and statistics modes

Based on the results of the Application Launch Control task execution, two types of report can be generated: report on prohibited applications (if the task is started in the Active mode), report on prohibited applications in test mode (if the task is started in the Statistics only mode). These reports display information about blocked applications on the protected servers of the network. Each report is generated for all administration groups and accumulates data from all the Kaspersky Lab applications installed on the protected devices.
To review a report on prohibited applications in test mode:

1. Start the Application Control task in the Statistics only mode (see Section "Configuring Applications Launch Control task settings" on page 354).
2. Select the Administration Server <computer name> node in the Administration Console tree.
3. Open the Reports tab.
4. Double-click the Report on prohibited applications in test mode list item.
   A report is generated.
5. Review the following report details:
   - A graphical diagram that displays top ten applications with most amount of blocked starts.
   - A summary table of occurred application blocks specifying the executable file name, reason, time of blocking and number of devices where it occurred.
   - A detailed table specifying data about the device, file path and criteria for blocking.

To review a report on prohibited applications in the Active mode:

1. Start the Application Control task in the Active mode (see Section "Configuring Applications Launch Control task settings" on page 354),
2. Select the Administration Server <computer name> node in the Administration Console tree.
3. Open the Reports tab.
4. Double-click a Report on prohibited applications list item.
   A report is generated.
This report consists of the same data blocks as the report on prohibited applications in test mode.
Working with the Kaspersky Security for Windows Server Console

This section provides information about the Kaspersky Security for Windows Server Console and describes how to manage the application using the Application Console installed on the protected server or another computer.

In this chapter

- Kaspersky Security for Windows Server settings in the Application Console ............................................ 139

Kaspersky Security for Windows Server settings in the Application Console

General settings and malfunction diagnostics settings of Kaspersky Security for Windows Server settings establish the general conditions on which the application operates. These settings allow you to control the number of working processes used by Kaspersky Security for Windows Server, enable Kaspersky Security for Windows Server task recovery after an abnormal termination, maintain the tracking log, enable creating dump file of Kaspersky Security for Windows Server processes in case of an abnormal termination, and configure other general settings.

Application settings cannot be configured in the Application Console if the Kaspersky Security Center active policy blocks changes to these settings.
To configure Kaspersky Security for Windows Server settings:

1. In the Application Console tree, select the Kaspersky Security node and do one of the following:
   - Click the Application properties link in the details pane of the node.
   - Select Properties in the node's context menu.
   The Application settings window opens.

2. In the window that opens, configure general Kaspersky Security for Windows Server settings according to your preferences:
   - The following settings can be configured on the Scalability and interface tab:
     - In the Scalability settings section:
       - Maximum number of working processes that Kaspersky Security for Windows Server can run

<table>
<thead>
<tr>
<th>Setting</th>
<th>Maximum number of active processes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>This setting belongs to the Scalability settings group in Kaspersky Security for Windows Server. It sets the maximum number of active processes that application can run simultaneously. Increasing the number of processes running in parallel increases the speed of file scanning and improves the fail-safety of Kaspersky Security for Windows Server. However, if the value of this setting is too high, it may reduce the general server performance and increase RAM usage. In the Administration Console of the Kaspersky Security Center application you can change the Maximum number of active processes setting only for Kaspersky Security for Windows Server installed on a stand-alone computer (using the Application settings dialog box); however, you cannot modify this setting in the policy settings for group of computers.</td>
</tr>
<tr>
<td>Possible values</td>
<td>1 – 8</td>
</tr>
<tr>
<td>Default Value</td>
<td>The application handles scalability automatically depending on the number of processors on the computer:</td>
</tr>
<tr>
<td>Number of processors</td>
<td>Maximum number of active processes</td>
</tr>
<tr>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>1&lt; number of processors &lt; 4</td>
<td>2</td>
</tr>
<tr>
<td>4 or more</td>
<td>4</td>
</tr>
</tbody>
</table>
Number of processes for Real-Time Computer Protection

Table 21. Number of processes for Real-Time Protection

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>This setting belongs to the Scalability settings group in Kaspersky Security for Windows Server. Using this setting you can specify the fixed number of processes in which Kaspersky Security for Windows Server will execute Real-Time Protection tasks. A higher value of this setting will increase the scan speed in the Real-Time Protection tasks. However, the more processes Kaspersky Security for Windows Server uses, the greater its influence will be on the general performance of the protected computer and usage of RAM resources. In the Administration Console of the Kaspersky Security Center application you can change the Number of processes for Real-Time Protection setting only for Kaspersky Security for Windows Server installed on a stand-alone computer (using the Application settings window); however, you cannot modify this setting in the policy settings for group of computers.</td>
</tr>
<tr>
<td>Possible values</td>
<td>Possible values: 1-N where N is the value specified using the Maximum number of active processes setting. If you set the value of the Number of processes for Real-Time Protection setting as equal to the maximum number of active processes, you will reduce the impact of Kaspersky Security for Windows Server on the rate of the file exchange between the computers and the computer, thus further improving its performance during Real-Time Protection. However, update tasks and On-Demand Scan tasks with the Medium (Normal) basic priority will be executed in Kaspersky Security for Windows Server processes which are already running. On-Demand Scan tasks will be executed with less speed. If the execution of a task causes an abnormal termination of a process, it will take more time to restart it. On-Demand Scan tasks with the Low basic priority are always executed in a separate process or processes.</td>
</tr>
<tr>
<td>Default Value</td>
<td>Kaspersky Security for Windows Server handles scalability automatically depending on the number of processors on the computer:</td>
</tr>
</tbody>
</table>
- Number of working processes for background On-Demand Scan tasks

Table 22. Number of processes for background On-Demand Scan tasks

<table>
<thead>
<tr>
<th>Setting</th>
<th>Number of processes for background On-Demand Scan tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>This setting belongs to the <strong>Scalability settings</strong> group in Kaspersky Security for Windows Server. You can use this setting to specify the maximum number of processes which the application will use to run On-Demand Scan tasks in the background mode. The number of processes specified by this setting is not included in the total number of Kaspersky Security for Windows Server processes specified by the <strong>Maximum number of active processes</strong> setting. For example, if you specify the following values of settings: - Maximum number of active processes – 3; - Number of processes for Real-Time Protection tasks – 3; - Number of processes for background On-Demand Scan tasks – 1; and then start Real-Time Protection tasks and one On-Demand Scan task in background mode, the total number of kavfswp.exe processes of Kaspersky Security for Windows Server will be 4. Several On-Demand Scan tasks can be running in one process with low priority. You can increase the number of processes, for example, if you run several tasks in background mode in order to allocate a separate process for each task. Allocating separate processes for tasks increases the reliability and speed of task execution.</td>
</tr>
<tr>
<td>Possible values</td>
<td>1-4</td>
</tr>
<tr>
<td>Default Value</td>
<td>1</td>
</tr>
</tbody>
</table>

- In the **Interaction with user** section select if the System Tray Icon will be displayed in the taskbar after each application start (see Section “System Tray Icon in notification area” on page 149).
- The following settings can be configured on the **Security and reliability** tab:
  - In the **Reliability settings** section, specify the number of attempts to recover an On-Demand Scan task after it crashed.

Table 23. Task recovery

<table>
<thead>
<tr>
<th>Setting</th>
<th>Task recovery (Perform task recovery)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description</td>
<td>This setting belongs to the <strong>Reliability settings</strong> group in Kaspersky Security for Windows Server. It enables recovery of tasks in case of their emergency termination and defines the number of attempts used to recover On-Demand Scan tasks. When a task crashes, the kavfs.exe process of Kaspersky Security for Windows Server attempts to restart the process in which that task was running at the time of the crash. If task recovery is disabled, the application does not restore the Real-Time Protection and On-Demand Scan tasks. If task recovery is enabled, the application attempts to restore the Real-Time Protection tasks until they are started successfully and tries to restore On-Demand Scan tasks using the number of attempts specified in the setting.</td>
</tr>
</tbody>
</table>
In the **Actions when switching to UPS backup power** section, specify actions that Kaspersky Security for Windows Server performs after switching to UPS power:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Actions when switching to UPS backup power.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Description</strong></td>
<td>This setting determines the actions that Kaspersky Security for Windows Server performs when the computer switches to an uninterruptible power supply source.</td>
</tr>
<tr>
<td><strong>Possible values</strong></td>
<td>Run or do not run On-Demand Scan tasks to be started according to schedule. Perform or stop all active On-Demand Scan tasks.</td>
</tr>
</tbody>
</table>
| **Default Value**               | By default, if uninterruptible power supply is used to power the computer, Kaspersky Security for Windows Server:  
  • Does not run On-Demand Scan tasks that run according to schedule.  
  • Automatically stops all active On-Demand Scan tasks. |

In the **Password protection settings** section, configure the settings for password-protection of the application's functions (see Section "Password-protected access to Kaspersky Security for Windows Server functions" on page 234).

On the **Connection settings** tab:

- In the **Proxy server settings** section, specify the proxy server usage settings.
- In the **Proxy server authentication settings** section specify authentication type and details required for authentication on the proxy server.
- In the **Licensing** section, indicate whether Kaspersky Security Center will be used as a proxy-server for application activation.

On the **Malfunction diagnosis** tab:

- If you want the application to write debug information to file, select the **Write debug information to trace file** check box.
  - In the field below specify the folder in which Kaspersky Security for Windows Server will save trace files.
  - Configure the level of detail of debug information.
    - This drop-down list lets you select the level of detail of debug information that Kaspersky Security for Windows Server saves to the trace file.
    - You can select one of the following detail levels:
      - **Critical events** – Kaspersky Security for Windows Server saves information only about critical events to the trace file.
• **Errors** – Kaspersky Security for Windows Server saves information about critical events and errors to the trace file.

• **Important events** – Kaspersky Security for Windows Server saves information about critical events, errors, and important events to the trace file.

• **Informational events** – Kaspersky Security for Windows Server saves information about critical events, errors, important events, and informational events to the trace file.

• **All debug information** – Kaspersky Security for Windows Server saves all debug information to the trace file.

A Technical Support representative determines the detail level that needs to be set in order to resolve the issue that arose.

The default level of detail is set to **All debug information**.

The drop-down list is available if the **Write debug information to trace file** check box is selected.

• Specify the maximum size of trace files.

• Specify the components to be debugged.

A list of codes of Kaspersky Security for Windows Server components for which application saves debug information in the trace file. Component codes must be separated with a semicolon. The codes are case sensitive (see table below).

---

**Table 25. Kaspersky Security for Windows Server subsystem codes**

<td>Subsystem for basic functionality.</td>
</tr>
<tr>
<td>updater</td>
<td>Subsystem for updating databases and software modules.</td>
</tr>
<tr>
<td>snmp</td>
<td>SNMP protocol support subsystem.</td>
</tr>
</tbody>
</table>
The trace settings of the Kaspersky Security for Windows Server snap-in (gui) and the Kaspersky Security for Windows Server Administration Plug-in for Kaspersky Security Center (ak_conn) are applied after these components are restarted. The trace settings of the SNMP protocol support subsystem (snmp) are applied after the SNMP service is restarted. The trace settings of the performance counters subsystem (perfcount) are applied after all processes that use performance counters are restarted. Trace settings for other Kaspersky Security for Windows Server subsystems are applied as soon as the crash diagnostics settings are saved.

The entry field is available if the **Write debug information to trace file** check box is selected.

- If you want the application to create a dump file, select the **Create crash dump file** check box.

### Kaspersky Security for Windows Server settings

Diagnostics data can only be sent by the user with the corresponding permissions.

- In the field below, specify the folder in which Kaspersky Security for Windows Server will save the memory dump file.

Kaspersky Security for Windows Server writes information to trace files and the dump files in unencrypted form. The folder where files are saved is selected by the user and is managed by the operating system configuration and Kaspersky Security for Windows Server settings. You can configure access permissions (see Section "Managing access permissions for Kaspersky Security for Windows Server functions" on page 228) and allow access to logs, trace and dump files only for required users.

3. Click **OK**.

Kaspersky Security for Windows Server settings are saved.

### About the Kaspersky Security for Windows Server Console

Kaspersky Security for Windows Server Console is an isolated snap-in added to the Microsoft Management Console.

The application can be managed via the Application Console installed on the protected server or on another computer on the corporate network.

After the Application Console has been installed on another computer, advanced configuration is required.

If the Application Console and Kaspersky Security for Windows Server are installed on different computers assigned to different domains, limitations may be imposed on delivery of information from the application to the Application Console. For example, after any application task starts, its status may remain unchanged in the Application Console.
During installation of the Application Console the installation wizard creates the kavfs.msc file in the Installation folder and adds Kaspersky Security for Windows Server snap-in to the list of isolated Microsoft Windows snap-ins.

You can start the Application Console from the Start menu. The Kaspersky Security for Windows Server snap-in msc-file can be run or added to the existing Microsoft Management Console as a new element in the tree.

Under a 64-bit version of Microsoft Windows, the Kaspersky Security for Windows Server snap-in can be added only in the 32-bit version of Microsoft Management Console. To do so, open Microsoft Management Console from the command line by executing the command: mmc.exe /32.

Multiple Kaspersky Security for Windows Server snap-ins can be added to one Microsoft Management Console opened in author mode to use it to manage the protection of multiple servers on which Kaspersky Security for Windows Server is installed.

Kaspersky Security for Windows Server Console interface

The Kaspersky Security for Windows Server Console is displayed in the Microsoft Management Console tree in the form of a node with the name Kaspersky Security.

After a connection has been established to Kaspersky Security for Windows Server installed on a different server, the name of the node is supplemented with the name of the server on which the application is installed and the name of the user account under which the connection has been established: Kaspersky Security <server name> as <account name>. Upon connection to Kaspersky Security for Windows Server installed on the same server with the Application Console, the node name is Kaspersky Security.

By default, the Application Console window includes the following elements:

- Application Console tree
- Details pane
- Toolbar

The Application Console tree

The Application Console tree displays the Kaspersky Security node and the child nodes of functional components of the application.

The Kaspersky Security node includes the following child nodes:

- **Real-Time Server Protection**: manages real-time protection tasks and KSN services. The Real-Time Server Protection node allows to configure the following tasks:
  - Real-Time File Protection
  - Script Monitoring
  - KSN Usage
  - Traffic Security
  - Anti-Cryptor
- **Server Control**: controls launches of applications installed on a protected server, as well as external devices connections. The Server Control node allows to configure the following tasks:
• Applications Launch Control
• Device Control
• Firewall Management
• **Automated rule generators**: configuring automatic generation of group and system rules for the Applications Launch Control task and the Device Control task.
  • Rule Generator for Applications Launch Control
  • Rule Generator for Device Control
  • Rule generation group tasks `<Task names>` (if any)
    Group tasks (see Section "Kaspersky Security for Windows Server task categories" on page 152) are created using Kaspersky Security Center. You cannot manage group tasks through the Application Console.
• **System Inspection**: configuring file operations control and Windows Event Log inspection settings.
  • File Integrity Monitor
  • Log Inspection
• **Network Attached Storage Protection**: configure the network storage protection tasks.
  • RPC Network Storage Protection
  • ICAP Network Storage Protection
  • Anti-Cryptor for NetApp
• **On-Demand Scan**: manages On-Demand Scan tasks. There is a separate node for each task:
  • Scan at Operating System Startup
  • Critical Areas Scan
  • Quarantine Scan
  • Application Integrity Control
  • Custom tasks `<Task names>` (if any)
    The node displays system tasks (see Section "Kaspersky Security for Windows Server task categories" on page 152) created when the application is installed, custom tasks, and group on-demand scan tasks created and sent to a computer using Kaspersky Security Center.
• **Update**: manages updates for Kaspersky Security for Windows Server databases and modules and copies the update to a local update source folder. The node contains child nodes for administering each update task and the last Rollback of Database Update task:
  • Database Update
  • Software Modules Update
  • Copying Updates
  • Rollback of Database Update
    The node displays all custom and group update tasks (see Section "Kaspersky Security for Windows Server task categories" on page 152) created and sent to a computer using Kaspersky Security Center.
• **Storages**: Management of Quarantine, Backup and Blocked Hosts settings.
  • Quarantine
• Backup
• Blocked Hosts
  • Security log
  • System audit log
  • Task logs
• Licensing: add or delete Kaspersky Security for Windows Server keys and activation codes, view license details.

Details pane
The details pane displays information about the selected node. If the Kaspersky Security node is selected, the details pane displays information about the current server protection status (see Section "Viewing protection status and Kaspersky Security for Windows Server information" on page 162) and information about Kaspersky Security for Windows Server, the protection status of its functional components, and the license expiration date.

Context menu of the Kaspersky Security node
You can use the items of the context menu of the Kaspersky Security node to perform the following operations:

• Connect to another computer. Connect to another computer (see Section "Managing Kaspersky Security for Windows Server via the Application Console on another computer" on page 150) to manage Kaspersky Security for Windows Server installed on it. You can also perform this operation by clicking the link in the lower right corner of the details pane of the Kaspersky Security node.
• Start the service / Stop the service. Start or stop application or a selected task (see Section "Starting / pausing / resuming / stopping tasks manually" on page 152). To carry out these operations, you can also use the buttons on the toolbar. You can also perform these operations in context menus of application tasks.
• Configure removable drives scan settings. Configure scanning of removable drives (see Section "About the Removable Drives Scan" on page 457) connected to the protected server via the USB port.
• Exploit Prevention: general settings. Configure the Exploit Prevention mode and set up preventing actions.
• Exploit Prevention: processes protection settings. Add processes for protection and select the exploit prevention techniques (see Section "Exploit prevention techniques" on page 514).
• Configure Trusted Zone settings. View and configure Trusted Zone settings (see Section "About the Trusted Zone" on page 492).
• Modify user rights of the application management. View and configure permissions to access Kaspersky Security for Windows Server functions (see Section "Managing access permissions for Kaspersky Security for Windows Server functions" on page 228).
• Hierarchical storage. Configure access method of the HSM system (see Section "Configuring HSM system settings via the Application Console" on page 517).
• Export settings. Save the application settings in a configuration file in XML format (see Section "Exporting settings" on page 158). You can also perform this operation in context menus of application tasks.
• Import settings. Import application settings from a configuration file in XML format (see Section "Importing settings" on page 158). You can also perform this operation in context menus of application tasks.

• Information about the application and available module updates. See information about Kaspersky Security for Windows Server and currently available application modules updates.

• Refresh. Refresh the contents of the Application Console window. You can also perform this operation in context menus of application tasks.

• Properties. View and configure settings of Kaspersky Security for Windows Server or a selected task. You can also perform this operation in context menus of application tasks.

| To do so, you can also use the Application properties link in the details pane of the Kaspersky Security node or use the button on the toolbar. |

• Help. View information Kaspersky Security for Windows Server Help. You can also perform this operation in context menus of application tasks.

Toolbar and context menu of Kaspersky Security for Windows Server tasks

You can manage Kaspersky Security for Windows Server tasks using the items of context menus of each task in the Application Console tree.

You can use the items of the context menu to perform the following operations:

• Resume / Pause. Resume or pause task (see Section "Starting / pausing / resuming / stopping tasks manually" on page 152) execution. To carry out these operations, you can also use the buttons on the toolbar. This operation is available for the Real-Time Protection tasks and the On-Demand Scan tasks.

• Add task. Create new custom task (see Section "Creating and configuring an On-Demand Scan task" on page 476). This operation is available for On-demand scan tasks.

• Open log. View and manage a task log (see Section "About task logs" on page 208). This operation is available for all tasks.

• Save task. Save and apply modified task settings. This operation is available for Real-Time File Protection and On-Demand Scan tasks.

• Remove task. Delete custom task. This operation is available for On-demand scan tasks.

• Statistics. View task statistics. This operation is available for the Application Integrity Control task.

• Settings templates. Manage templates (see Section "Using security settings templates" on page 159). This operation is available for Real-Time File Protection and On-Demand Scan.

System Tray Icon in notification area

Every time Kaspersky Security for Windows Server automatically starts after a computer reboot, the System Tray Icon is displayed in the toolbar notification area K. It is displayed by default if the System Tray Icon component was installed during application setup.

The appearance of the System Tray Icon reflects the current status of server protection. The two statuses are possible:
active (colored icon) if at least one of the tasks is currently running: Real-Time File Protection, Applications Launch Control

inactive (black-and-white icon) if none of the tasks are currently running: Real-Time File Protection, Applications Launch Control

You can open the context menu of the System Tray Icon by right-clicking it.

The context menu offers several commands which can be used to display application windows (see the table below).

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Open the Application Console</td>
<td>Opens Kaspersky Security for Windows Server Console (if installed).</td>
</tr>
<tr>
<td>Open Compact Diagnostic Interface</td>
<td>Open the Compact Diagnostic Interface.</td>
</tr>
<tr>
<td>About the application</td>
<td>Opens the About the application window containing information about Kaspersky Security for Windows Server. For registered Kaspersky Security for Windows Server users, the About the application window contains information about urgent updates that have been installed.</td>
</tr>
<tr>
<td>Hide</td>
<td>Hides the System Tray Icon in the toolbar notification area.</td>
</tr>
</tbody>
</table>

You can display the hidden System Tray Icon again at any time.

To display the application icon again,

in the Start menu of Microsoft Windows, select All Programs > Kaspersky Security for Windows Server > System Tray Icon.

The names of settings may vary depending on the installed operating system.

In the general settings of Kaspersky Security for Windows Server, you can enable or disable the display of the System Tray Icon every time the application starts automatically following a server reboot.

Managing Kaspersky Security for Windows Server via the Application Console on another computer

You can manage Kaspersky Security for Windows Server via the Application Console installed on a remote computer.

To manage the application using Kaspersky Security for Windows Server Console on a remote computer, make sure that:
• The Application Console users on the remote computer are added to the KAVWSEE Administrators group on the protected server.

• Network connections are allowed for the Kaspersky Security Management Service process (kavfsgt.exe) if Windows Firewall is enabled on the protected server.

• During installation of Kaspersky Security for Windows Server, the **Allow remote access** check box was selected in the Installation Wizard window.

If Kaspersky Security for Windows Server on the remote computer is password protected, enter the password to get access for application management via the Application Console.

### Managing Kaspersky Security for Windows Server tasks

This section contains information about Kaspersky Security for Windows Server tasks, and how to create them, configure task settings, and start and stop them.

**In this section**

- Kaspersky Security for Windows Server task categories .......................................................... 152
- Starting / pausing / resuming / stopping tasks manually .............................................................. 152
- Managing task schedules ........................................................................................................ 153
- Using user accounts to start tasks ............................................................................................. 155
- Importing and exporting settings .............................................................................................. 156
- Using security settings templates ............................................................................................. 159
Kaspersky Security for Windows Server task categories

Real-Time Server Protection, Server Control, On-Demand Scan, and Update functions in Kaspersky Security for Windows Server are implemented as tasks.

You can manage tasks using the task's context menu in the Application Console tree, the toolbar, and the quick access bar. You can view task status information in the details pane. Task management operations are recorded in the system audit log.

There are two types of Kaspersky Security for Windows Server tasks: local and group.

Local tasks
Local tasks are executed only on the protected server for which they are created. Depending on the start method, the following types of local tasks exist:

- **Local system tasks.** Created automatically during installation of Kaspersky Security for Windows Server. You can edit the settings of all system tasks, except for the Quarantine Scan and Rollback of Database Update tasks. System tasks cannot be renamed or deleted. You can run system and custom On-Demand Scan tasks simultaneously.

- **Local custom tasks.** In the Application Console, you can create On-Demand Scan tasks. In Kaspersky Security Center you can create On-Demand Scan, Database Update, Rollback of Database Update, and Copying Updates tasks. Such tasks are called custom tasks. Custom tasks can be renamed, configured, and deleted. You can run several custom tasks simultaneously.

Group tasks
Group tasks and tasks for sets of computers created using Kaspersky Security Center are displayed in the Application Console. Such tasks are called group tasks. Group tasks can be managed and configured from the Kaspersky Security Center. In the Application Console, you can only view the status of group tasks.

Starting / pausing / resuming / stopping tasks manually

You can pause and resume only Real-Time Server Protection and On-Demand Scan tasks.

► To start / pause / resume / stop a task, take the following steps:

1. Open the context menu of the task in the Application Console.
2. Select one of the following: **Start, Pause, Resume** or **Stop**.

The operation is executed and registered in the system audit log (on page 206).

When an On-Demand Scan task is resumed, Kaspersky Security for Windows Server continues with the object that was being scanned when the task was paused.
Managing task schedules

You can configure the start schedule for Kaspersky Security for Windows Server tasks, and configure settings for running tasks by schedule.

In this section

- Configuring the task start schedule settings ......................................................... 153
- Enabling and disabling scheduled tasks ................................................................. 154

Configuring the task start schedule settings

You can configure the start schedule for local system and custom tasks in the Application Console. You cannot configure the start schedule for group tasks.

To configure task start schedule settings:

1. Open the context menu for the task for which you wish to configure the start schedule.
2. Select Properties. The Task settings window opens.
3. In the window that opens, on the Schedule tab, select the Run by schedule check box.
4. Configure schedule settings in accordance with your requirements. To do this, perform the following actions:
   a. In the Frequency, select one of the following values:
      - Hourly, if you want the task to run at intervals of a specified number of hours; specify the number of hours in the Every <number> hour(s) field.
      - Daily, if you want the task to run at intervals of a specified number of days; specify the number of days in the Every <number> day(s) field.
      - Weekly, if you want the task to run at intervals of a specified number of weeks; specify the number of weeks in the Every <number> week(s) on field. Specify the days of the week on which the task will be started (by default the task runs on Mondays).
      - At application launch, if you want the task to run every time Kaspersky Security for Windows Server starts.
      - After application database update, if you want the task to run after every update of the application databases.
   b. Specify the time for the first task start in the Start time field.
   c. In the Start date field, specify the date from which the schedule applies.

After you have specified the task start frequency, the time of the first task start, and the date from which the schedule applies, information about the estimated time for the next task start will appear in the top part of the window in the Next start field. Updated information about the estimated time of the next task start will be displayed each time you open the Task settings window of the Schedule tab.
5. Use the **Advanced** tab to configure the following schedule settings in accordance with your requirements.

   - In the **Task stop settings** section:
     a. Select the **Duration** check box and enter the required number of hours and minutes in the fields to the right to specify the maximum duration of the task execution.
     b. Select the **Pause from** check box and enter the start and end values of the time interval in the fields to the right to specify a time interval under 24 hours during which task execution will be paused.

   - In the **Advanced settings** section:
     a. Select the **Cancel schedule from** check box and specify the date from which the schedule will cease to operate.
     b. Select the **Run skipped tasks** check box to enable the start of skipped tasks.
     c. Select the **Randomize the task start within interval of** check box and specify a value in minutes.

6. Click **OK**.
   The configured task start settings will be saved.

### Enabling and disabling scheduled tasks

You can enable and disable scheduled tasks either before or after configuring the schedule settings.

＞ **To enable or disable the task start schedule, take the following steps:**

1. In the Application Console tree open the context menu on the task name for which you wish to configure the start schedule.
2. Select **Properties**.
   The **Task settings** window opens.
3. In the window that opens on the Schedule tab, do one of the following:
   - Select the **Run by schedule** check box if you want to enable scheduled task start.
   - Clear the **Run by schedule** check box if you want to disable scheduled task start.

   The configured task start schedule settings are not deleted and will be applied at the next scheduled start of the task.

4. Click **OK**.
   The configured task start schedule settings are saved.
Using user accounts to start tasks

You can start tasks under the system account or specify a different account.

In this section

About using accounts to start tasks ............................................................... 155
Specifying a user account to start a task ....................................................... 155

About using accounts to start tasks

You can specify the account under which you want to run the selected task for the following functional components of Kaspersky Security for Windows Server:

- Rule Generator for Applications Launch Control and Rule Generator for Device Control tasks
- On-Demand Scan task
- Update tasks

By default, these tasks are run using system account permissions.

A different account with proper access permissions is recommended in the following cases:

- In the Update task, if you specified a public folder on a different computer on the network as the update source.
- In the Update task, if a proxy server with built-in Windows NTLM authentication is used to access the update source.
- In On-Demand Scan tasks, if the system account does not possess permissions to access any of the scanned objects (for example, to files in shared folders on the server).
- In the Rule Generator for Applications Launch Control task, if after completion of the task the generated rules are exported to a configuration file located at a path that the system account cannot access (for example, in one of the shared folders on the server).

Specifying a user account to start a task

To specify an account to start a task, take the following steps:

1. In the Application Console tree, open the context menu of the task for which you want to configure start with account permissions.
2. Select **Properties**.
   The **Task settings** window opens.

3. In the window that opens, do the following on the **Run as** tab:
   a. Select **User name**.
   b. Enter the user name and password for the account you want to use.

   The selected user must be registered on the protected server or in the same domain as this server.

   c. Confirm the password that has been entered.

4. Click **OK**.
   The modified settings to run the task with the user account permissions are saved.

**Importing and exporting settings**

This section provides information about how to export the settings of Kaspersky Security for Windows Server or the settings of specific software components to a configuration file in XML format and how to import those settings from that configuration file back to the application.

**In this section**

- About importing and exporting settings .......................................................... 156
- Exporting settings ............................................................................................ 158
- Importing settings ............................................................................................ 158

**About importing and exporting settings**

You can export Kaspersky Security for Windows Server settings to an XML configuration file and import settings into Kaspersky Security for Windows Server from the configuration file. You can save all application settings or only settings for individual components to a configuration file.

When you export all settings of Kaspersky Security for Windows Server to a file, the general application settings and settings of the following Kaspersky Security for Windows Server components and functions are saved:

- Real-Time File Protection
- KSN Usage
- Device Control
- Applications Launch Control
- Rule Generator for Device Control
- Rule Generator for Applications Launch Control
- On-Demand Scan tasks
- Traffic Security
• Script Monitoring
• ICAP Network Storage Protection
• RPC Network Storage Protection
• Anti-Cryptor for NetApp
• File Integrity Monitor
• Log Inspector
• Kaspersky Security for Windows Server database and software modules update
• Quarantine
• Backup
• Logs
• Administrator and user notifications
• Trusted Zone
• Exploit Prevention
• Blocked Hosts storage
• Password protection

Also, you can save the general settings of Kaspersky Security for Windows Server in the file, as well as the rights of user accounts.

You cannot export group task settings.

Kaspersky Security for Windows Server exports all passwords used by the application, for example, account data for running tasks or connecting to a proxy server. Exported passwords are saved in encrypted form in the configuration file. You can import passwords only using Kaspersky Security for Windows Server installed on this server if it has not been reinstalled or updated.

You cannot import previously saved passwords using Kaspersky Security for Windows Server installed on a different computer. After settings have been imported on another, all passwords must be entered manually.

If a Kaspersky Security Center policy is active at the time of export, the application exports the specified values used by that policy.

Settings from a configuration file containing parameters for individual components of Kaspersky Security for Windows Server (e.g., from a file created in Kaspersky Security for Windows Server installed with incomplete set of components) can be imported. After the settings are imported, only those Kaspersky Security for Windows Server settings that were contained in the configuration file are changed. All other settings remain the same.

Settings of an active Kaspersky Security Center policy that have been blocked do not change when importing the settings.
Exporting settings

To export settings to a configuration file, take the following steps:

1. In the Application Console tree, do one of the following:
   - In the context menu of the Kaspersky Security node, select Export settings to export all Kaspersky Security for Windows Server settings.
   - In the context menu for the task whose settings you want to export, select Export settings to export the settings of an individual functional component of the application.
   - To export the settings of the Trusted Zone component:
     a. In the Application Console tree, open the context menu of the Kaspersky Security node.
     b. Select Configure Trusted Zone settings.
        The Trusted Zone window opens.
     c. Click the Export button.
        The welcome window of the settings export wizard opens.
2. Follow the instructions in the Wizard: specify the name of the configuration file for saving settings and the path to it.
   System environment variables can be used when specifying the path; user environment variables are not allowed.
   If a Kaspersky Security Center policy is active at the time of export, the application exports the settings' values used by that policy.
3. Click the Close button in the Export of application settings complete window.
   The export settings are saved when the wizard closes.

Importing settings

To import settings from a saved configuration file, take the following steps:

1. In the Application Console tree, do one of the following:
   - In the context menu of the Kaspersky Security node, select Import settings to import all Kaspersky Security for Windows Server settings.
   - In the context menu for the task whose settings you want to import, select Import settings to import the settings of an individual functional component of the application.
   - To import the settings of the Trusted Zone component:
     a. In the Application Console tree, open the context menu of the Kaspersky Security node.
     b. Select Configure Trusted Zone settings.
        The Trusted Zone window opens.
     c. Click the Import button.
        The welcome window of the settings import wizard opens.
2. Follow the instructions in the Wizard: specify the configuration file from which you want to import settings.
After you have imported the general settings of Kaspersky Security for Windows Server or its functional components on the server, you will not be able to return to the previous setting values.

3. Click the Close button in the Application settings import completed window.
   The imported settings are saved when the wizard closes.
4. In the toolbar of the Application Console, click the Refresh button.
   The imported settings are displayed in the Application Console window.

Kaspersky Security for Windows Server does not import passwords (account data to start tasks or connect to the proxy server) from the file created on another server or on the same server, after Kaspersky Security for Windows Server has been re-installed or updated on it. After the importing operation is completed, passwords must be entered manually.

Using security settings templates

This section contains information about using security settings templates in Kaspersky Security for Windows Server protection and scan tasks.

In this section

- About security settings templates ................................................................. 159
- Creating a security settings template ............................................................ 160
- Viewing security settings in a template ......................................................... 160
- Applying a security settings template ............................................................ 160
- Deleting a security settings template ............................................................. 161

About security settings templates

You can manually configure a node’s security settings in the tree or in a list of the computer’s file resources, and save the configured setting values as a template. This template can then be used to configure the security settings of other nodes in Kaspersky Security for Windows Server protection and scan tasks.

Templates can be used to configure the security settings of the following Kaspersky Security for Windows Server tasks:

- Real-Time File Protection
- RPC Network Storage Protection
- Scan at Operating System Startup
- Critical Areas Scan
- On-Demand Scan tasks
Security settings from a template applied to a parent node in the computer's file resource tree are applied to all child nodes. A parent node's template is not applied to child nodes in the following cases:

- If the security settings of the child nodes were configured separately (see Section "Applying a security settings template" on page 160).
- If the child nodes are virtual. You must apply the template to each virtual node separately.

Creating a security settings template

► To manually save the security settings of a node and save those settings to a template:

1. In the Application Console tree, select the task for which you want to apply the security setting template.
2. In the details pane of the selected task, click the Configure protection scope or Configure scan scope link.
3. In the tree or in the list of the server's network file resources, select the template that you want to view.
4. On the Security level tab click the Save as template button.
   The Template properties window opens.
5. In the Template name field, enter the name of the template.
6. Enter additional template information in the Description field.
7. Click OK.
   The template with the set of security settings is saved.

Viewing security settings in a template

► To view security settings in a template that you have created, perform the following steps:

1. In the Application Console tree, select the task for which you want to view the security template.
2. In the context menu of the selected task, select Settings templates.
   The Templates window opens.
3. In the list of templates in the window that opens, select the template that you want to view.
4. Click the View button.
   The <Template name> window opens. The General tab displays the template name and additional information about the template; the Options tab lists security settings saved in the template.

Applying a security settings template

► To apply security settings from a template for a selected node:

1. In the Application Console tree, select the task for which you want to apply the security setting template.
2. In the details pane of the selected task, click the Configure protection scope or Configure scan scope link.
3. In the tree or in the list of the server's network file resources, open the context menu of the node or item to which you want to apply the template.
4. Select **Apply template → <Template name>**.
5. Click the **Save** button.

The security settings template is applied to the selected node in the tree of the server's file resources. The **Security level** tab of the selected node now has the value **Custom**.

Security settings from a template applied to a parent node in the server's file resource tree are applied to all child nodes.

If the protection scope or scan scope of the child nodes in the server’s file resource tree was configured separately, the security settings from the template applied to the parent node are not automatically applied to such child nodes.

To apply security settings from a template to all selected nodes, take the following steps:

1. In the Application Console tree, select the task for which you want to apply the security setting template.
2. In the details pane of the selected task, click the **Configure protection scope** or **Configure scan scope** link.
3. In the tree or in the list of the server's network file resources, select a parent node in order to apply the template to the selected node and to all of its child nodes.
4. In the context menu, select **Apply template → <Template name>**.
5. Click the **Save** button.

The security settings template is applied to the parent and all child nodes in the server's file resource tree. The **Security level** tab of the selected node now has the value **Custom**.

Deleting a security settings template

To delete a security settings template, take the following steps:

1. In the Application Console tree, select the task for which you no longer want to use a security settings template for configuration.
2. In the context menu of the selected task, select **Settings templates**.

You can view settings templates for On-Demand Scan tasks from the details pane of the **On-Demand Scan** parent node.

The **Templates** window opens.
3. In the list of templates in the window that opens, select the template that you want to delete.
4. Click the **Remove** button.

A window opens to confirm the deletion.
5. In the window that opens, click **Yes**.
The selected template is deleted.

If the security settings template was applied to protect or scan nodes of the server's file resources, the configured security settings for such nodes are preserved after the template is deleted.

### Viewing protection status and Kaspersky Security for Windows Server information

- **To view information about the server protection status Kaspersky Security for Windows Server,** select the **Kaspersky Security** node in the Application Console tree.

  By default, information in the details pane of the Application Console is refreshed automatically:
  - Every 10 seconds in case of a local connection.
  - Every 15 seconds in case of a remote connection.

  You can refresh the information manually.

- **To refresh information in the Kaspersky Security node manually,** select the **Refresh** command in the context menu of the **Kaspersky Security** node.

  The following application information is displayed in the details pane of the Application Console:
  - Kaspersky Security Network Usage status.
  - Server protection status.
  - Information about database and application module updates.
  - Actual diagnostic data.
  - Data about server control tasks.
  - License information.
  - Status of integration with Kaspersky Security Center: details of the computer with Kaspersky Security Center installed and to which the application is connected; information about application tasks controlled by the active policy.

  Different colors are used to indicate the protection status:
  - **Green.** The task is being run in accordance with the configured settings. Protection is active.
  - **Yellow.** The task was not started, has been paused, or has been stopped. Security threats may occur. You are advised to configure and start the task.
  - **Red.** The task completed with an error or a security threat was detected while the task was running. You are advised to start the task or take measures to eliminate the detected security threat.
Some details in this block (for example, task names or the number of threats detected) are links that, when clicked, take you to the node of the relevant task or open the task log.

The **Kaspersky Security Network Usage** section displays current task status, for example, *Running*, *Stopped* or *Never performed*. The indicator can take the following values:

- Green – The KSN Usage task is running and the requests for URLs statuses are being sent to KSN.
- Yellow – One of the Statements is accepted, but the task is not running; or the requests for URLs statuses are not being sent to KSN.

**Server protection**

The **Server protection** section (see the table below) displays information about the server's current protection status.

<table>
<thead>
<tr>
<th>Protection section</th>
<th>Information</th>
</tr>
</thead>
</table>
| **Server protection status indicator** | The color of the panel with the section name reflects the status of tasks being performed in the section. The indicator can take the following values:  
  - Green – This color is displayed by default and signifies that Real-Time File Protection component is installed and the task is running.  
  - Yellow – The Real-Time File Protection component is not installed, and the Critical Areas Scan task has not been performed for a long time.  
  - Red – Real-Time File Protection task is not running. |
| **Real-Time File Protection** |  
  - **Task status** – Current task status, for example, *Running* or *Stopped*.  
  - **Detected** – Number of objects detected by Kaspersky Security for Windows Server. For example, if Kaspersky Security for Windows Server detects one malware program in five files, the value in this field increases by one. If the number of detected malware programs exceeds 0, the value is highlighted in red. |
| **Critical Areas Scan** |  
  - **Last scan date** – Date and time of the last Critical Areas Scan for viruses and other computer security threats.  
  - **Never performed** – An event that occurs when the Critical Areas Scan task has not been performed in the last 30 days or longer (default value). You can change the threshold for generating this event. |
| **Traffic Security** |  
  - **Task status** – Current task status, for example, *Running* or *Stopped*.  
  - **Outlook add-in** – installed or not installed. |
| **Exploit prevention** |  
  - **Status** – current status of exploit prevention techniques, for example, *Applied* or *Not Applied*.  
  - **Prevention mode** – one of two available modes, selected during configuration of process memory protection:  
    - Terminate on exploit.  
    - Statistics only.  
  - **Processes protected** – the total number of processes added to the protection scope and handled in accordance with the selected mode. |
<table>
<thead>
<tr>
<th>Protection section</th>
<th>Information</th>
</tr>
</thead>
</table>
| Backed up objects  | *Backup free space threshold exceeded* – This event occurs when the amount of free space in Backup is approaching the specified limit. Kaspersky Security for Windows Server continues to move objects to Backup. In this case, the value in the *Space used* field is highlighted in yellow.  
*Maximum Backup size exceeded* – This event occurs when the Backup size has reached the specified limit. Kaspersky Security for Windows Server continues to move objects to Backup. In this case, the value in the *Space used* field is highlighted in red.  
*Backed up objects* – Number of objects currently in Backup.  
*Space used* – Amount of Backup space used. |
### Update

The **Update** section (see the table below) displays information about how up-to-date the anti-virus databases and application modules are.

<table>
<thead>
<tr>
<th>Updates section</th>
<th>Information</th>
</tr>
</thead>
</table>
| **Status indicator for databases and software modules** | The color of the panel with the section name reflects the status of application databases and modules. The indicator can take the following values:  
  - **Green** – This color is displayed by default and signifies that application databases are up to date and that the last Database Update task was completed successfully.  
  - **Yellow** – Databases are out of date, or the last database update task failed.  
  - **Red** – The event *Application databases are extremely out of date or Application databases are corrupted* has occurred. |

| Database Update and Software Modules Update          | Database status – An evaluation of the Database Update task status.  
  It can take the following values:  
  - **Application database is up to date** – Application databases were updated no more than 7 days ago (default).  
  - **Application database is out of date** – Application databases were updated between 7 and 14 days ago (default).  
  - **Application database is extremely out of date** – Application databases were updated more than 14 days ago (default).  
  
  You can change the thresholds for generating the events *Application databases are out of date and Application databases are outdated*. |

<table>
<thead>
<tr>
<th></th>
<th>Database release date – Date and time of the release of the latest database update. The date and time are specified in UTC format.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Status of the latest completed Database Update task – Date and time of the latest database update. The date and time are specified according to the local time of the protected server. The field is red if the Failed event occurred.</td>
</tr>
</tbody>
</table>
|                                                   | **Number of module updates available** – Number of Kaspersky Security for Windows Server module updates available to be downloaded and installed.  
  **Number of module updates installed** – Number of installed Kaspersky Security for Windows Server module updates. |
Control

The **Control** section (see table below) displays information about the Applications Launch Control, Device Control, Anti-Cryptor and Firewall Management tasks.

**Table 29. Information about server control status**

<tr>
<td><strong>Log Inspection</strong></td>
<td>Task status – Current task status, for example, <em>Running</em> or <em>Stopped</em>.   Possible violations – Number of recorded violations based on data from the Windows Event Log. This number is determined based on the specified task rules or using the heuristic analyzer.</td>
</tr>
</tbody>
</table>

The Kaspersky Security for Windows Server licensing information is displayed in the row in the bottom left corner of the details pane of the **Kaspersky Security** node.

You can configure Kaspersky Security for Windows Server properties by following the Application Properties link (see Section "Kaspersky Security for Windows Server settings in the Application Console" on page 139).

You can connect to a different computer by following the **Connect to another computer** link (see Section "Managing Kaspersky Security for Windows Server via the Application Console on another computer" on page 150).

To review the detailed information about Network Attached Storage Protection tab, see the Kaspersky Security for Windows Server Implementation Guide for Network Storages Protection.
Compact Diagnostic Interface

This section describes how to use the Compact Diagnostic Interface for reviewing server status or current activity, and how to configure writing of dump and trace files.

In this chapter

- About the Compact Diagnostic Interface ................................................................. 168
- Reviewing Kaspersky Security for Windows Server status via the Compact Diagnostic Interface .......... 169
- Reviewing security event statistics ........................................................................ 170
- Reviewing current application activity .................................................................... 170
- Configuring writing of dump and trace files ......................................................... 171

About the Compact Diagnostic Interface

The Compact Diagnostic Interface component (also referred to as the "CDI") is installed and uninstalled along with the System Tray Icon component independently from the Application Console, and can be used when the Application Console is not installed on the protected server. The CDI is started from the System Tray Icon or by running kavfsmui.exe from the application folder on the server.

From the CDI window, you can do the following:

- Review information about general application status (see Section "Reviewing Kaspersky Security for Windows Server status via the Compact Diagnostic Interface" on page 169).
- Review security incidents that have occurred (see Section "Reviewing security event statistics" on page 170).
- Review current activity on the protected (see Section "Reviewing current application activity" on page 170) server.
- Start or stop writing dump and trace files (see Section "Configuring writing of dump and trace files" on page 171).
- Open the Application Console.
- Open the About the application window with the list of installed updates and available patches.

The CDI is available even if access to Kaspersky Security for Windows Server functions is password-protected. No password is required.

The CDI component cannot be configured via Kaspersky Security Center.
Reviewing Kaspersky Security for Windows Server status via the Compact Diagnostic Interface

To open the Compact Diagnostic Interface window, perform the following actions:

1. Right-click the Kaspersky Security for Windows Server System Tray Icon in the toolbar notification area.
2. Select the Open Compact Diagnostic Interface option.

The Compact Diagnostic Interface window opens.

Review the current status of the key, Real-Time Server Protection tasks, and Update tasks on the Protection status tab. Different colors are used to notify the user about the protection status (see table below).

<table>
<thead>
<tr>

</tbody>
</table>

**Reviewing security event statistics**

The **Statistics** tab displays all security events. Each protection task statistic is displayed in a separate block specifying the number of incidents and the date, and time when the last incident occurred. When an incident is logged, the block color changes to red.

► **To review the statistics:**

1. Right-click the Kaspersky Security for Windows Server System Tray Icon in the toolbar notification area.
2. Select the **Open Compact Diagnostic Interface** option.
   - The **Compact Diagnostic Interface** window opens.
3. Open the **Statistics** tab.
4. Review the security incidents for the protection tasks.

**Reviewing current application activity**

On this tab, you can review the status of current tasks and application processes, and promptly get notifications about critical events that occur.

Different colors are used to indicate the application activity status:

- In the **Tasks** section:
  - **Green.** No conditions for yellow or red.
  - **Yellow.** Critical areas have not been scanned for a long time.
  - **Red.** Any of the following conditions is true:
    - No tasks are started and a start schedule is not set up for any of the tasks.
    - Application launch errors are logged as critical events.
- In the **Kaspersky Security Network** section:
  - **Green.** The KSN Usage task is started.
  - **Yellow.** The KSN Statement is accepted, but the task is not started.
To review the current application activity on the server:

1. Right-click the Kaspersky Security for Windows Server System Tray Icon in the toolbar notification area.
2. Select the Open Compact Diagnostic Interface option.
   The Compact Diagnostic Interface window opens.
3. Open the Current application activity tab.
4. Review the following information in the Tasks section:
   - Critical areas not scanned for a long time
     This field is displayed only if the application returns a corresponding warning about critical areas scans.
   - Running now
   - Execution failed
   - Next start defined by a schedule
5. Review the following information in the Kaspersky Security Network section:
   - KSN is on. File reputation services are enabled or Protection is off.
   - Application statistics is being sent to KSN.
     The application sends information about malware, including fraudulent software, detected during execution of the Real-Time File Protection task and the On-Demand Scan tasks, as well as debugging information about errors during scanning.
     The field is displayed if the Send Kaspersky Security Network statistics check box is selected in the KSN Usage task settings.
6. Review the following information in the Integration with Kaspersky Security Center section:
   - Local management is allowed.
   - Policy is applied: <Kaspersky Security Center server name>.

Configuring writing of dump and trace files

You can configure the writing of dump and trace files via the CDI.

You can also configure malfunction diagnostics via the Application Console (see Section "Kaspersky Security for Windows Server settings in the Application Console" on page 139).

To start writing dump and trace files, perform the following actions:

1. Right-click the Kaspersky Security for Windows Server System Tray Icon in the toolbar notification area.
2. Select the Open Compact Diagnostic Interface option.
   The Compact Diagnostic Interface window opens.
3. Open the Troubleshooting tab.
4. Change the following trace settings if necessary:
   a. Select the **Write debug information to the trace file in this folder** check box.
   b. Click the **Browse** button to specify the folder where Kaspersky Security for Windows Server will save trace files.
      Tracing will be enabled for all components with the default parameters using the **Debug** level of detail and the default maximum log size of 50 MB.

5. Change the following dump-file settings if necessary:
   a. Select the **Create dump file on malfunction in this folder** check box.
   b. Click the **Browse** button to specify the folder where Kaspersky Security for Windows Server will save the dump file.

6. Click the **Apply** button.
   A new configuration will be applied.
Updating Kaspersky Security for Windows Server databases and software modules

This section provides information about databases and software modules update tasks of Kaspersky Security for Windows Server, copying updates and rolling back databases updates of Kaspersky Security for Windows Server, as well as instructions on how to configure databases and software modules update tasks.

About Update tasks

By default Kaspersky Security for Windows Server connects to the updates source (one of Kaspersky Lab's update computers) every hour. You can configure all Update tasks (see Section "Configuring Update tasks" on page 178), except for the Rollback of Database Update task. When task settings are modified, Kaspersky Security for Windows Server will apply the new values at the next task start.

You are not allowed to pause and resume Update tasks.

Database Update

By default, Kaspersky Security for Windows Server copies databases from the update source to the protected server and immediately starts using them in the running Real-Time Server Protection task. The On-Demand Scan tasks start using the updated database at the next start.

By default, Kaspersky Security for Windows Server runs the Database Update task every hour.

Software Modules Update

By default, Kaspersky Security for Windows Server checks availability of software modules updates on the update source. In order to start using installed software modules, a computer restart and / or a restart of Kaspersky Security for Windows Server is required.

By default, Kaspersky Security for Windows Server runs the Software Modules Update task on a weekly basis on Fridays at 04:00 PM (time according to the regional settings of the protected server). During task execution, the
application checks for availability of important and scheduled updates of Kaspersky Security for Windows Server modules without distributing them.

**Copying Updates**

By default, during task execution, Kaspersky Security for Windows Server downloads Database Update files and saves them to the specified network or local folder without applying them.

The Copying Updates task is disabled by default.

**Rollback of Database Update**

During task execution, Kaspersky Security for Windows Server returns to using databases with previously installed updates.

The Rollback of Database Update task is disabled by default.

**About Kaspersky Security for Windows Server software modules update**

Kaspersky Lab can issue update packages for Kaspersky Security for Windows Server modules. The update packages can be *urgent* (or *critical*) and planned. Critical update packages repair vulnerabilities and errors; planned packages add new features or enhance existing features.

Urgent (critical) update packages are uploaded to Kaspersky Lab's update servers. Their automatic installation can be configured using the Software Modules Update task. By default, Kaspersky Security for Windows Server runs the Software Modules Update task on a weekly basis on Fridays at 04:00 PM (time according to the regional settings of the protected server).

Kaspersky Lab does not publish planned update packages on its update servers for automatic update; these can be downloaded from the Kaspersky Lab website. The Software Modules Update task can be used to receive information about the release of scheduled Kaspersky Security for Windows Server updates.

Critical updates can be updated from the Internet to each protected server, or one computer can be used as intermediary by copying all updates onto it and then distributing them to the network servers. In order to copy and save updates without installing them use the Copying Updates task.

Before updates of modules are installed Kaspersky Security for Windows Server creates backup copies of the previously installed modules. If the software modules updating process is interrupted or results in an error, Kaspersky Security for Windows Server will automatically return to using the previously installed software modules. Software modules can be rolled back manually to the previously installed updates.

During the installation of downloaded updates the Kaspersky Security Service automatically stops and then restarts.

**About Kaspersky Security for Windows Server Database Updates**

Kaspersky Security for Windows Server databases stored on the protected server quickly become outdated. Kaspersky Lab's virus analysts detect hundreds of new threats daily, create identifying records for them, and include them in application database updates. Database updates are a file or set of files containing records that identify threats discovered during the time since the last update was created. To maintain the required level of computer protection, we recommend that database updates are received regularly.

By default, if the Kaspersky Security for Windows Server databases are not updated within a week from the time at which the installed database updates were last created, the *Application database is out of date* event occurs. If the
databases are not updated for a period of two weeks, the Application database is extremely out of date event occurs. Information about the up-to-date status of the databases (see Section "Viewing protection status and Kaspersky Security for Windows Server information" on page 162) is displayed in the details pane of the Kaspersky Security node of the Application Console tree. You can use Kaspersky Security for Windows Server general settings to indicate a different number of days before these events occur. You can also configure administrator notifications about these events (see Section "Configuring administrator and user notifications" on page 219).

Kaspersky Security for Windows Server downloads updates of application databases and modules from FTP or HTTP update servers of Kaspersky Lab, Kaspersky Security Center Administration Server, or other update sources.

Updates can be downloaded to every protected server, or one server can be used as intermediary by copying all updates onto it and then distributing them to the computers. If you use Kaspersky Security Center for centralized administration of protection of servers in an organization, you can use Kaspersky Security Center Administration Server as an intermediary for downloading updates.

Database Update tasks can be started manually or based on a schedule (see Section "Configuring the task start schedule settings" on page 153). By default, Kaspersky Security for Windows Server runs the Database Update task every hour.

If the update downloading process is interrupted or results in an error Kaspersky Security for Windows Server will automatically switch back to using the databases with the last installed updates. If the Kaspersky Security for Windows Server databases become corrupted, they can be manually rolled back (see Section "Rolling back Kaspersky Security for Windows Server database updates" on page 184) to previously installed updates.

**Schemes for updating databases and modules of anti-virus applications used within organization**

Selection of updates source in the update tasks depends on the databases and program modules update scheme used in the organization.

Kaspersky Security for Windows Server databases and modules can be updated on the protected servers using the following schemes:

- Download updates directly from the Internet to each protected server (Scheme 1).
- Download updates from the Internet to an intermediary computer and distribute updates to servers from the computer.
  - Any computer with the software listed below installed can serve as an intermediary computer:
    - Kaspersky Security for Windows Server (one of the protected servers) (Scheme 2).
    - Kaspersky Security Center Administration Server (Scheme 3).

Updating using an intermediary computer will not only allow Internet traffic to be decreased, but will also ensure additional network servers security.

Description of update schemes listed is provided below.

**Scheme 1. Updating databases and modules directly from the Internet**

 ► To configure Kaspersky Security for Windows Server updates directly from the Internet:

  on each protected server in the settings of the Database Update task and the Software Modules Update task, specify Kaspersky Lab's update servers as the source of updates.
Other HTTP or FTP servers which have an update folder can be configured as the updates source.

Scheme 2. Updating databases and modules via one of the protected servers

To configure Kaspersky Security for Windows Server updates via one of the protected servers:

1. Copy updates to the selected protected server. To do this, perform the following actions:
   - Configure the Copying Updates task settings on the selected server:
     a. Specify Kaspersky Lab's update server as the updates source.
     b. Specify a shared folder to be used as the folder where updates are saved.

2. Distribute updates to other protected servers. To do this, perform the following actions:
   - On each protected server, configure the settings for the Database Update task and the Software Modules Update task (see figure below).
     a. For the update source, specify a folder on the intermediary computer's drive to which updates will be downloaded.

Kaspersky Security for Windows Server will obtain updates via one of the protected servers.
To configure Kaspersky Security for Windows Server updates via the Kaspersky Security Center Administration Server:

1. Download updates from Kaspersky Lab's update servers to Kaspersky Security Center Administration Server. To do this, perform the following actions:
   - Configure the Retrieve updates by Administration Server task for the specified set of computers:
     a. Specify Kaspersky Lab's update servers as the updates source.

2. Distribute updates to protected servers. To do so, perform one of the following actions:
   - On the Kaspersky Security Center configure an Anti-Virus database (application module) update group task to distribute updates to protected servers:
     a. In the task schedule specify **After Administration Server has retrieved updates** as start frequency.
        Administration Server will start the task each time it receives updates (recommended method).

The start frequency of **After Administration Server has retrieved updates** cannot be specified in the Application Console.
On each protected server, configure the Database Update task and the Software Modules Update task:

a. Specify the Kaspersky Security Center Administration Server as the update source.

b. Configure the task schedule if necessary.

If Kaspersky Security for Windows Server anti-virus databases are rarely updated (from once a month to once a year), the likelihood of detecting threats decreases and the frequency of false alarms raised by application components increases.

Kaspersky Security for Windows Server will obtain updates via the Kaspersky Security Center Administration Server.

If you plan to use Kaspersky Security Center administration server for updates distribution, install Network Agent, an application component included in the Kaspersky Security Center distribution kit, onto each of the protected servers. This ensures interaction between the Administration Server and Kaspersky Security for Windows Server on the protected server. Detailed information about the Network Agent and its configuration using Kaspersky Security Center is provided in the Kaspersky Security Center Help.

Configuring Update tasks

This section provides instructions on how to configure Kaspersky Security for Windows Server update tasks.

In this section

| Configuring settings for working with Kaspersky Security for Windows Server update sources | .................................................. 178 |
| Optimizing use of disk I/O when running Database Update task | .......................................................... 181 |
| Configuring Copying Updates task settings | ........................................................................ 182 |
| Configuring Software Modules Update task settings | ........................................................................ 182 |

Configuring settings for working with Kaspersky Security for Windows Server update sources

For each update task except the Rollback of Database Update task, you can specify one or several update sources, add user-defined update sources, and configure the settings for connection with the specified sources.

After update task settings are modified, the new settings will not be immediately applied in the running update tasks. The configured settings will be applied only when the task is restarted.
To specify the type of update source:

1. In the Application Console tree, expand the Update node.
2. Select the child node corresponding to the update task that you want to configure.
3. Click the Properties link in the details pane of the selected node.
   The Task settings window opens on the General tab.
4. In the Update source section, select the type of Kaspersky Security for Windows Server update source:
   - **Kaspersky Security Center Administration Server**
     Kaspersky Security for Windows Server uses Kaspersky Security Center Administration Server as the update source.
     You can only select this option if Kaspersky Lab applications on your network are administered using the Kaspersky Security Center remote access system and if Network Agent (the Kaspersky Security Center component that provides the connection between servers and Administration Server) is installed on the protected server.
   - **Kaspersky Lab update servers**
     Kaspersky Security for Windows Server uses Kaspersky Lab websites as update sources, hosting updates for the databases and software modules of all of the company's products.
     This option is selected by default.
   - **Custom HTTP or FTP servers, or network folders**
     Kaspersky Security for Windows Server uses the administrator-specified HTTP or FTP server or folders on local network folder as the update source.
     You can create a list of sources with the current updates by clicking the Custom HTTP or FTP servers, or network folders link.
5. If required, configure the advanced settings for user-defined update sources:
   a. Click on the Custom HTTP or FTP servers, or network folders link.
      i. In the Update servers window that opens, select or clear the check boxes next to the user-defined update sources in order to begin or terminate their use.
      ii. Click OK.
   b. In the Update source section on the General tab, select or clear the Use Kaspersky Lab update servers if specified servers are not available check box.
      This check box enables or disables the option of using Kaspersky Lab update servers as the update source if the user-defined update sources are unavailable.
      If the check box is selected, this function is enabled.
      The check box is selected by default.
      You can select the Use Kaspersky Lab update servers if specified servers are not available check box when the Custom HTTP or FTP servers, or network folders option is enabled.
6. In the **Task settings** window, select the **Connection settings** tab to configure the settings for connecting to update sources:

- Clear or select the **Use proxy server settings to connect to Kaspersky Lab update servers** check box.

  The check box enables/disables the use of proxy server settings if updates are received from Kaspersky Lab servers or if the **Use Kaspersky Lab update servers if specified servers are not available** check box is selected.

  If the check box is selected, the proxy server settings are used.

  If the check box is cleared, the proxy server settings are not used.

  The check box is selected by default.

- Clear or select the **Use proxy server settings to connect to other servers** check box.

  The check box enables or disables the use of proxy server settings if the option **Custom HTTP or FTP servers, or network folders** is selected as the update source.

  If the check box is selected, the proxy server settings are used.

  The check box is cleared by default.

For information about configuring the optional proxy server settings and authentication settings for accessing the proxy server, see Starting and configuring Kaspersky Security for Windows Server Database Update task section.

7. Click **OK**.

The configured settings for the Kaspersky Security for Windows Server update source will be saved and applied at the next task start.

You can manage the list of user-defined Kaspersky Security for Windows Server update sources.

► **To edit the list of user-defined application update sources:**

1. In the Application Console tree, expand the **Update** node.

2. Select the child node corresponding to the update task that you want to configure.

3. Click the **Properties** link in the details pane of the selected node.

   The **Task settings** window opens on the **General** tab.

4. Click on the **Custom HTTP or FTP servers, or network folders** link.

   The **Update servers** window opens.

5. Do the following:

- To add a new user-defined update source, in the entry field specify the address of the folder containing update files on the FTP or HTTP server; specify a local or network folder in the UNC (Universal Naming Convention) format. Press **ENTER**.

  By default, the added folder is used as the source of updates.

- To disable use of a user-defined source, clear the check box next to the source in the list.

- To enable use of a user-defined source, select the check box next to the source in the list.
In order to change the order in which Kaspersky Security for Windows Server accesses user-defined update sources, use the Move Up and Move Down buttons to move the selected source to the beginning or to the end of the list, depending on whether it is to be used before or after other sources.

To change the path to the user-defined source, select the source in the list and click the Edit button, make the required changes in the entry field and press the ENTER key.

To remove a user-defined source, select it in the list and press the Remove button.

You cannot delete the only remaining user-defined source from the list.

6. Click OK.
The changes in the list of user-defined application update sources will be saved.

Optimizing use of disk I/O when running Database Update task

When running the Database Update task, Kaspersky Security for Windows Server stores update files on the local disk of the server. You can lower the workload on the disk I/O subsystem of the server through storing update files on a virtual drive in the RAM when running the update task.

This feature is available for Microsoft Windows Vista, Microsoft Windows Server 2008 operating systems and higher.

When using this feature while running the Database Update task, an extra logical drive may appear in the operating system. This logical drive will be removed from the operating system after the task is completed.

► To lower the workload on your computer’s disk I/O subsystem during Database Update task, take the following steps:

1. In the Application Console tree, expand the Update node.
2. Select the Database Update child node.
3. Click the Properties link in the details pane of the Database Update node.
4. The Task settings window opens on the General tab.
5. In the Disk I/O usage optimization section, define the following settings:
   - Clear or select the Lower the load on the disk I/O check box.
     This check box enables or disables the feature of the disk subsystem optimization through storing update files on a virtual drive in the RAM.
     If the check box is selected, this function is enabled.
     The check box is cleared by default.
   - In the RAM used for optimization field, specify the RAM volume (in MB). The operating system temporarily allocates the specified RAM volume to store update files while running the task. The default RAM size is 512 MB. The minimum RAM size is 400 MB.
6. Click OK.
   The configured settings will be saved and applied at the next task start.

Configuring Copying Updates task settings

To configure the Copying Updates task:

1. In the Application Console tree, expand the Update node.
2. Select the Copying Updates child node.
3. Click the Properties link in the details pane of the Copying Updates node.
   The Task settings window opens.
4. On the General and Connection settings tabs, configure the settings for working with update sources
   (see Section "Configuring settings for working with Kaspersky Security for Windows Server update
   sources" on page 178).
5. On the General tab in the Copying updates settings section:
   - Specify the conditions for copying updates:
     - Copy database updates.
       Kaspersky Security for Windows Server downloads only software database updates.
       This option is selected by default.
     - Copy critical software modules updates.
       Kaspersky Security for Windows Server downloads only urgent Kaspersky Security for
       Windows Server software module updates.
     - Copy database updates and critical software modules updates.
       Kaspersky Security for Windows Server downloads software database updates and
       critical software module updates of Kaspersky Security for Windows Server.
   - Specify the local or network folder to which Kaspersky Security for Windows Server will be distributing
     downloaded updates.
6. On the Schedule and Advanced tabs configure the task start schedule (see Section "Configuring the task
   start schedule settings" on page 153).
7. On the Run as tab, configure the task to start using account permissions (see Section "Specifying a user
   account to start a task" on page 155).
8. Click OK.
   The configured settings will be saved and applied at the next task start.

Configuring Software Modules Update task settings

To configure the Software Modules Update task:

1. In the Application Console tree, expand the Update node.
2. Select the Software Modules Update child node.
3. Click the Properties link in the details pane of the Software Modules Update node.
The Task settings window opens.

5. On the General tab in the Application update settings section, configure the settings for updating application modules:

   - **Only check for critical software updates available**
     
     Kaspersky Security for Windows Server displays a notification about urgent updates to software modules available in the update source without downloading the updates. The notification is displayed if notifications about events of this type are enabled.
     
     This option is selected by default.

   - **Copy and install critical software modules updates**
     
     Kaspersky Security for Windows Server downloads and installs critical updates to software modules.

   - **Allow operating system restart**
     
     The operating system is restarted after installing updates that require a restart.
     
     If the check box is selected, Kaspersky Security for Windows Server reboots the operating system after installing updates that require a reboot.
     
     This check box is active if the Copy and install critical software modules updates option is selected.
     
     The check box is cleared by default.

   - **Receive information about available scheduled software modules updates**
     
     Notifications about all scheduled updates to Kaspersky Security for Windows Server software modules available in the update source are displayed. The application displays a notification if notifications are enabled for events of this type.
     
     If the check box is selected, Kaspersky Security for Windows Server displays a notification about all scheduled updates to software modules available in the update source.
     
     The check box is selected by default.

6. On the Schedule and Advanced tabs configure the task start schedule (see Section “Configuring the task start schedule settings” on page 153). By default, Kaspersky Security for Windows Server runs the Software Modules Update task on a weekly basis on Fridays at 04:00 PM (time according to the regional settings of the protected server).

7. On the Run as tab, configure the task start using account permissions (see Section “Specifying a user account to start a task” on page 155).

8. Click OK.

The configured settings will be saved and applied at the next task start.

Kaspersky Lab does not publish planned update packages on the update servers for automatic installation; these can be downloaded manually from the Kaspersky Lab website. Administrator notification about the New scheduled update of application software modules is available event can be configured; this will contain the URL of the page on the website from which scheduled updates can be downloaded.
Rolling back Kaspersky Security for Windows Server database updates

Before database updates are applied, Kaspersky Security for Windows Server creates backup copies of the previously used databases. If the update has been interrupted or has resulted in an error, Kaspersky Security for Windows Server will automatically return to using the previously installed databases.

If any problems arise after you have updated the databases, they can be rolled back to the previously installed updates through the Rollback of Database Update task.

► To start the Rollback of Database Update task:

- click the Start link in the details pane of the Rollback of Database Update node.

Rolling back application module updates

The names of settings may vary under different Windows operating systems.

Before applying updates of software modules, Kaspersky Security for Windows Server creates backup copies of the modules currently in use. If the modules updating process has been interrupted or has resulted in an error, Kaspersky Security for Windows Server will automatically return to using modules with the latest installed updates.

In order to roll back the software modules use the Microsoft Windows component Install and delete applications.

Update task statistics

While the update task is running, real-time information can be viewed about the amount of data downloaded since the task has been started until the present moment, and also other task execution statistics.

When the task is completed or stopped, you can view this information in the task log.

► To view update task statistics take the following steps:

1. In the Application Console tree, expand the Update node.
2. Select the child node that corresponds to the task whose statistics you want to view.

Task statistics are displayed in the Statistics section of the details pane of the selected node.

If you are viewing the Database Update task or the Copying Updates task the Statistics block shows the volume of data downloaded by Kaspersky Security for Windows Server on the present moment (Received data).

If you are viewing the Software Modules Update task, you will see the information described in the table below.
Table 32. Information about the Software Modules Update task

About quarantining of probably infected objects

Kaspersky Security for Windows Server quarantines probably infected objects by moving such objects from their original location to Quarantine folder. For security purposes, objects are stored in Quarantine folder in encrypted form.

Viewing Quarantine objects

Quarantined objects can be viewed in the Quarantine node of the Application Console.

▶ To view quarantined objects, take the following steps:

1. In the Application Console tree, expand the Storages node.
2. Select the **Quarantine** child node.
   Information about quarantined objects is displayed in the details pane of the selected node.

   ► **To find the required object in the list of Quarantined objects,**

   sort the objects (see Section "Sorting quarantined objects" on page 187) or filter the objects (see Section "Filtering quarantined objects" on page 187).

**In this section**

<table>
<thead>
<tr>
<th>Sorting quarantined objects</th>
<th>Filtering quarantined objects</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>187</td>
</tr>
</tbody>
</table>

**Sorting quarantined objects**

By default, objects in the list of quarantined objects are sorted by date of quarantining in reverse chronological order. To find the desired object you may sort objects by columns with information about the objects. Sorted results will be saved if you close and then re-open the **Quarantine** node, or if you close the Application Console, save the msc file and then re-open it from this file.

► **To sort objects, take the following steps:**

1. In the Application Console tree, expand the **Storages** node.
2. Select the **Quarantine** child node.
3. In the details pane of the **Quarantine** node, select the column heading that you wish to use to sort objects in the list.

   Objects in the list will be sorted based on the selected setting.

**Filtering quarantined objects**

To find the required quarantined object you can filter objects in the list - display only those objects that satisfy the filtering criteria (filters) that you specify. Filtered results are saved if you leave and then reopen the **Quarantine** node or if you close the Application Console, save the msc file and then reopen it from this file.

► **To specify one or multiple filters, take the following steps:**

1. In the Application Console tree, expand the **Storages** node.
2. Select the **Quarantine** child node.
3. Select **Filter** in the context menu of the node's name.

   The **Filter settings** window opens.
4. To add a filter, perform the following steps:
   a. In the **Field name**, select an item to which the filter value will be compared.
   b. In the **Operator** list, select the filtering condition. The values of the filtering conditions in the list may differ depending on the value you have selected in the **Field name** list.
   c. Enter the filter value in the **Field value** field or select it from the list.
   d. Click the **Add** button.

   The filter you have added will appear in the list of filters in the **Filter settings** window. Repeat steps a-d for each filter you add. Use the following guidelines while working with filters:
   - To combine multiple filters using the logical operator "AND", select **If all conditions are met**.
   - To combine multiple filters using the logical operator "OR", select **If any condition is met**.
   - In order to delete a filter, select the filter you wish to delete in the filter list, and click the **Remove** button.
   - In order to edit a filter, select the filter in the list in the **Filter settings** window. Then change the required values in the **Field name**, **Operator** or **Field value** fields and click the **Replace** button.

5. After all filters have been added, click the **Apply** button.

   The created filters will be saved.

   ► **In order to re-display all objects in the list of quarantined objects,**

   select **Remove** filter in the context menu of the **Quarantine** node.

### Quarantine Scan

By default, after each database update, Kaspersky Security for Windows Server performs the Quarantine Scan system task. Task settings are described in the table below. The Quarantine Scan task settings cannot be modified.

You can configure the task start schedule (see Section "Configuring the task start schedule settings" on page 153), start it manually, and modify the permissions of the account (see Section "Specifying a user account to start a task" on page 155) used to start the task.

Having scanned Quarantine objects after updating the databases, Kaspersky Security for Windows Server can reclassify some of them as not infected: the status of such objects is changed to **False alarm**. Other objects can be reclassified as infected, in which case Kaspersky Security for Windows Server handles such objects as specified by the Quarantine Scan task settings: disinfect, or delete if disinfection failed.

Restoring quarantined objects

Kaspersky Security for Windows Server places probably infected objects into the quarantine folder in encrypted form to shield the protected server against their possible harmful effect.

You can restore any object from the quarantine. This may be required in the following cases:

- If after the quarantine scan using the updated database the status of the object changed to **False alarm** or **Disinfected**.
- If you consider the object harmless for the server and wish to use it. If you do not want Kaspersky Security for Windows Server to isolate this object during the subsequent scans you can exclude this object from the processing in the Real-Time File Protection task and in the On-Demand Scan tasks. To do this, specify the object as the value of the **Exclude files** (by filename) or **Do not detect** security setting in those tasks, or add it to the **Trusted Zone** (on page 492).

When you restore objects you can select where the object being restored will be saved to: original location (by default), special folder for restored objects on the protected server or custom folder on server where the Application Console is installed or on another computer in the network.

The **Restore to folder** option is used for storing restored objects on the protected server. You can configure special security settings for it to be scanned. The path to this folder is set by the Quarantine settings.

Restoring objects from the quarantine may lead to server infection.

You can restore the object and save its copy in the quarantine folder to use it later, for example in order to rescan the object after the database has been updated.

If a quarantined object was contained in a compound object (for example in an archive), Kaspersky Security for Windows Server will not include into this compound object during the restoration, rather it will save separately into a selected folder.

You can restore one or several objects.

► **To restore quarantined objects, perform the following steps:**

1. In the Application Console tree, expand the **Storages** node.
2. Select the **Quarantine** child node.
3. Perform one of the following actions in the details pane of the **Quarantine** node:
   - To restore one object, select **Restore** from the context menu of the object that you want to restore.
   - To restore multiple objects select the objects you wish to restore using the **CTRL** or **SHIFT** key, right-click one of the selected objects and select **Restore** from the context menu.

   The **Restore object** window opens.

4. In the **Restore object** window, specify folder into which the object being restored will be saved for each of the selected object.
The name of the object is displayed in the **Object** field in the upper part of the window. If you selected several objects, the name of the first object in the list of selected objects will be displayed.

5. Perform one of the following steps:
   - To restore an object to its original location, select **Restore to the source folder**.
   - To restore an object to the folder specified as the location for restored objects in the settings, select **Restore to the default folder for restoration**.
   - To save an object to a different folder on server where the Application Console is installed or to a shared folder, select **Restore to folder on your local computer or on network resource** and then select required folder or specify path to it.

6. If you wish to save a copy of the object in the Quarantine folder after this objects is restored, clear the **Remove objects from storage after they are restored** check box.

7. In order to apply the specified restoration conditions to the rest of the selected objects, check the **Apply to all selected objects** box.
   
   All selected objects are restored and saved in the specified location: if you selected **Restore to the source folder**, each of the objects will be saved into its original location if you selected **Restore to the default folder for restoration** or **Restore to folder on your local computer or on network resource** - all objects will then be saved into one specified folder.

8. Click **OK**.
   
   Kaspersky Security for Windows Server will start restoring the first of the selected objects.

9. If an object with this name already exists in the specified location, the **Object with this name already exists** window opens.
   a. Select one of the following Kaspersky Security for Windows Server actions:
      - **Replace**, in order to restore an object instead of the existing one.
      - **Rename**, to save the restored object under a different name. In the entry field enter a new object's filename and full path to it.
      - **Rename by adding suffix**, to rename the object by adding a suffix to its filename. Enter suffix in the entry field.
   b. If you have selected several objects to be restored, then in order to apply the selected action, such as **Replace** or **Rename**, by adding suffix to the rest of the selected objects, select the **Apply to all selected objects** check box. (If you have selected the **Rename** value, the **Apply to all selected objects** check box will be unavailable).
   c. Click **OK**.
      
      The object will be restored. Information about the restoration operation will be entered into the system audit log.
      
      If you did not select option **Apply to all selected objects** in the **Restore object** window, the **Restore object** window will open again. Using this window you can specify the location into which next selected object will be saved (see Step 4 of this procedure).
Moving objects to Quarantine

You can quarantine files manually.

► To quarantine a file take the following steps:

1. In the Application Console tree, open the context menu of the Quarantine node.
2. Select Add.
3. In the Open window, select the file on the disk that you wish to quarantine.
4. Click OK.
   Kaspersky Security for Windows Server will quarantine the selected file.

Deleting objects from Quarantine

According to the settings of the Quarantine Scan task, Kaspersky Security for Windows Server automatically deletes objects from the Quarantine folder if their status has changed to *Infected* during the scan of Quarantine with the updated databases and if Kaspersky Security for Windows Server has failed to disinfect them. Kaspersky Security for Windows Server does not remove other objects from Quarantine.

One or multiple objects can be deleted from Quarantine.

► To delete one or multiple objects from the Quarantine take the following steps:

1. In the Application Console tree, expand the Storages node.
2. Select the Quarantine child node.
3. Perform one of the following steps:
   - To remove one object, select Remove in the context menu of the name of the object.
   - To delete multiple objects, select the objects that you want to delete using the Ctrl or Shift key, open the context menu on any of the selected objects and select Remove.
4. In the confirmation window, click the Yes button to confirm operation.
   The selected objects will be removed from quarantine.

Sending probably infected objects to Kaspersky Lab for analysis

If the behavior of a file gives you a reason to suspect that it contains a threat, and Kaspersky Security for Windows Server considers this file to be clean, you may have encountered an unknown threat whose signature has not yet been added to the databases. You may send this file to Kaspersky Lab for analysis. Kaspersky Lab's Anti-Virus analysts will analyze it and, if they detect a new threat in it, will add a record identifying it in the databases. It is likely that when you rescan the object after the database has been updated Kaspersky Security for Windows Server will find this object to be infected and will be able to disinfect it. You will not only be able to keep the object, but will prevent a virus outbreak.

Only quarantined files can be sent for analysis. Quarantined files are stored in encrypted form and are not deleted by the Anti-Virus application installed on the mail server during transfer.

Quarantined object cannot be sent for analysis to Kaspersky Lab after the license expires.
To send a file for analysis to Kaspersky Lab take the following steps:

1. If the file was not quarantined, first move it into Quarantine.
2. In the Quarantine node, open the context menu on the file which you wish to send for analysis and select Send object for analysis in the context menu.
3. In the confirmation window that opens, click Yes if you are sure you want to send the selected object for analysis.
4. If a mail client is configured on the server on which the Application Console is installed, a new email message is created. Review it and click the Send button.

   The Receiver field contains the Kaspersky Lab email address newvirus@kaspersky.com. The Subject field will contain the text "Quarantined object".

   The body of the message will contain the following text: "This file will be sent to Kaspersky Lab for analysis". Any additional information about the file, why you considered it probably infected or dangerous, how it behaves, or how it affects the system, can be included in the body of the message.

   Archive <object name>.cab will be attached to the message. This archive will contain file <uuid>.klq with the object in encrypted form, file <uuid>.txt with information about the object extracted by Kaspersky Security for Windows Server, as well as the file Sysinfo.txt, which contains the following information about Kaspersky Security for Windows Server and the operation system installed on the server:
   - Name and version of the operating system.
   - Name and version of Kaspersky Security for Windows Server.
   - Release date of the latest database update installed.
   - Active key.

   This information is required by Kaspersky Lab's anti-virus analysts in order analyze your file faster and more efficiently. If, however, you do not wish to transfer this information you can delete Sysinfo.txt file from the archive.

   If a mail client is not installed on the server with the Application Console, the application prompts you to save the selected encrypted object to file. This file can be sent to Kaspersky Lab manually.

To save an encrypted object to a file, take the following steps:

1. In the window that opens with a prompt to save the object, click OK.
2. Select a folder on the drive of the protected server or a network folder where the file containing the object will be saved.

   The object will be saved to a CAB file.

Configuring Quarantine settings

You can configure quarantine settings. New Quarantine settings are applied immediately after saving.

To configure Quarantine settings take the following steps:

1. In the Application Console tree, expand the Storages node.
2. Open the context menu of the Quarantine child node.
4. In the **Quarantine Properties** window, configure the necessary quarantine settings in accordance with your requirements:

- **In the **Quarantine settings** section:**

  - **Quarantine folder**
    Path to the Quarantine folder in UNC (Universal Naming Convention) format.
    The default path is `C:\ProgramData\Kaspersky Lab\Kaspersky Security for Windows Server\10.1\Quarantine\`.

  - **Maximum Quarantine size**
    This check box enables or disables the function that monitors the total size of objects stored in the Quarantine folder. If the specified value is exceeded (the default value being 200 MB), Kaspersky Security for Windows Server logs the *Maximum Quarantine size exceeded* event and issues a notification according to the settings for notifications about events of this type.
    
    If the check box is selected, Kaspersky Security for Windows Server monitors the total size of objects placed in Quarantine.
    
    If the check box is cleared, Kaspersky Security for Windows Server does not monitor the total size of objects placed in Quarantine.
    
    The check box is cleared by default.

  - **Threshold value for space available**
    The check box enables or disables the function that monitors the minimum amount of free space in Backup (the default value being 50 MB). If the amount of free space decreases below the specified threshold, Kaspersky Security for Windows Server logs the *Backup free space threshold exceeded* event and issues a notification according to the settings for notifications about events of this type.
    
    If the check box is selected, Kaspersky Security for Windows Server monitors the amount of free space in Backup.
    
    The Threshold value for space available (MB) check box is active if the **Maximum Backup size (MB)** check box is selected.
    
    The check box is selected by default.

5. Click **OK**.

The newly configured settings for Quarantine will be saved.

---

**Quarantine statistics**

You can view information about the number of quarantined objects - quarantine statistics.
In order to view quarantine statistics, in the context menu of the **Quarantine** node in the Application Console tree, select **Statistics**.

The **Statistics** window displays information about the number of objects currently stored in Quarantine (see the following table):

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Probably infected objects</strong></td>
<td>Number of objects found by Kaspersky Security for Windows Server to be probably infected.</td>
</tr>
<tr>
<td><strong>Used quarantine space</strong></td>
<td>Total size of data in the quarantine folder.</td>
</tr>
<tr>
<td><strong>False alarms</strong></td>
<td>The number of objects that received <em>False alarm</em> status because they were classified as non-infected during the quarantine scan using updated databases.</td>
</tr>
<tr>
<td><strong>Objects disinfected</strong></td>
<td>The number of objects that received <em>Disinfected</em> status after the quarantine scan.</td>
</tr>
<tr>
<td><strong>Total number of objects</strong></td>
<td>Total number of objects in Quarantine.</td>
</tr>
</tbody>
</table>

**Making backup copies of objects. Backup**

This section provides information about backup of detected malicious objects before disinfection or deletion, as well as instructions for configuring Backup.

In this section

- About backing up objects before disinfection or deletion ................................................................. 195
- Viewing objects stored in Backup ........................................................................................................... 196
- Restoring files from Backup .................................................................................................................... 198
- Deleting files from Backup ........................................................................................................................ 199
- Configuring Backup settings ......................................................................................................................... 200
- Backup statistics ............................................................................................................................................. 201

**About backing up objects before disinfection or deletion**

Kaspersky Security for Windows Server stores encrypted copies of objects classified as *Infected* or *Probably infected* in **Backup** before disinfecting or deleting them.

If the object is a part of a compound object (for example, part of an archive), Kaspersky Security for Windows Server will save such a compound object in its entirety in Backup. For example, if Kaspersky Security for Windows Server has detected that one of the objects from a mail database is infected, it will back up the entire mail database.
Large objects placed in Backup by Kaspersky Security for Windows Server can slow down the system and reduce disk space on the hard drive.

Files can be restored from Backup either to their original folder or to a different folder on the protected server or on another computer in the local area network. A file can be restored from Backup, for example, if an infected file contained important information, but during the disinfection of this file Kaspersky Security for Windows Server was unable to maintain its integrity and therefore the information became unavailable.

Restoring files from Backup may lead to server infection.

**Viewing objects stored in Backup**

Objects can be stored in the Backup folder only by using the Application Console in Backup node. They cannot be viewed using Microsoft Windows file managers.

► **In order to view the objects in Backup,**

1. In the Application Console tree, expand the Storages node.
2. Select the Backup child node.
   Information about objects placed into Backup is displayed in the details pane of the selected node.

► **To find the necessary object in the list of objects in Backup,**

sort the objects or filter the objects.

**In this section**

<table>
<thead>
<tr>
<th>Sorting files in Backup</th>
<th>Filtering files in Backup</th>
</tr>
</thead>
<tbody>
<tr>
<td>..........................................................</td>
<td>..........................................................</td>
</tr>
</tbody>
</table>

**Sorting files in Backup**

By default, files in Backup are sorted by the date of saving in reverse chronological order. To find the required file, you can sort files according to the content of any column in the details pane.

Sorted results are saved if you leave and then reopen the Backup node or if you close the Application Console, save the msc file and then reopen it from this file.
To sort files in Backup, take the following steps:

1. In the Application Console tree, expand the Storages node.
2. Select the Backup child node.
3. In the list of files in Backup select the column heading which you wish to use for sorting the objects.

Files in Backup will be sorted based on the selected criterion.

Filtering files in Backup

To find the required file in Backup you can filter files: display in the Backup node only those files which satisfy the filtering criteria you have specified (filters).

The sorting result will be saved if you leave and then re-open the Backup node or if you close the Application Console, save the msc file and then re-open it from this file.

To filter files in Backup, take the following steps:

1. In the Application Console tree, open the context menu of the Backup node and select Filter.
   The Filter settings window opens.
2. To add a filter, perform the following steps:
   a. From the Field name list select the field against whose values the filter values will be compared during selection.
   b. In the Operator list select the filtering condition. The values of the filtering conditions in the list may differ depending on the value you have selected in the Field name field.
   c. Enter the filter value in the Field value field or select filter value.
   d. Click the Add button.

The filter you have added will appear in the list of filters in the Filter settings window. Repeat these steps for each filter you add. The following guidelines can be used while working with the filters:

- To combine multiple filters using the logical operator “AND”, select If all conditions are met.
- To combine multiple filters using the logical operator “OR”, select If any condition is met.
- In order to delete a filter, select the filter you wish to delete in the filter list, and click the Remove button.
- To edit the filter, select it from the filter list in the Filter settings window, modify the required values in the Field name, Operator or Field value fields and click the Replace button.

When all filters have been added, click the Apply button. Only files selected by the filters you have specified will then be displayed in the list.

In order to display all files included in the list of objects stored in Backup,

select Remove filter in the context menu of the Backup node.
Restoring files from Backup

Kaspersky Security for Windows Server stores files in the Backup folder in encrypted form in order to protect the protected server against their possible harmful effect.

Any file can be restored from Backup.

A file may need to be restored in the following cases:

- If the original file, which appeared to be infected, had been containing important information and Kaspersky Security for Windows Server failed to keep its integrity so, as a result, the information in the file became unavailable.
- If you consider the file harmless to the server and wish to use it. If you do not wish Kaspersky Security for Windows Server to consider this file infected or probably infected, during subsequent scans you can exclude it from processing in the Real-Time File Protection task and in the On-Demand Scan tasks. To do this, specify the file as the Exclude files setting or as the Do not detect setting in the corresponding tasks.

Restoring files from Backup may lead to server infection.

When you restore a file you can select where it will be saved: in the original location (by default), the special folder for restored objects on the protected server, or a custom folder on the server where the Application Console is installed or another computer in the network.

The Restore to folder is used for storing restored objects on the protected server. You can configure special security settings for it to be scanned. The path to this folder is specified by Backup settings (see Section "Configuring Backup settings" on page 200).

By default when Kaspersky Security for Windows Server is restoring a file it makes a copy of it in Backup. The file copy can be deleted from Backup after it is restored.

To restore files from Backup take the following steps:

1. In the Application Console tree, expand the Storages node.
2. Select the Backup child node.
3. Perform one of the following actions in the details pane of the Backup node:
   - To restore one object, select Restore from the context menu of the object that you want to restore.
   - To restore multiple objects select the objects you wish to restore using the CTRL or SHIFT key, right-click one of the selected objects and select Restore from the context menu.

   The Restore object window opens.
4. In the Restore object window, specify folder into which the object being restored will be saved for each of the selected object.

   The name of the object is displayed in the Object field in the upper part of the window. If you selected several objects, the name of the first object in the list of selected objects will be displayed.
5. Perform one of the following steps:
   - To restore an object to its original location, select **Restore to the source folder**.
   - To restore an object to the folder specified as the location for restored objects in the settings, select **Restore to the default folder for restoration**.
   - To save an object to a different folder on server where the Application Console is installed or to a shared folder, select **Restore to folder on your local computer or on network resource** and then select required folder or specify path to it.

6. If you do not want to save a copy of the file in the Backup folder after it is restored, select the **Remove objects from storage after they are restored** check box (by default, this check box is cleared).

7. In order to apply the specified restoration conditions to the rest of the selected objects, check the **Apply to all selected objects** box.

   All selected objects are restored and saved in the specified location: if you selected **Restore to the source folder**, each of the objects will be saved into its original location if you selected **Restore to the default folder for restoration** or **Restore to folder on your local computer or on network resource** - all objects will then be saved into one specified folder.

8. Click **OK**.

   Kaspersky Security for Windows Server will start restoring the first of the selected objects.

9. If an object with this name already exists in the specified location, the **Object with this name already exists** window opens.
   a. Select one of the following Kaspersky Security for Windows Server actions:
      - **Replace**, in order to restore an object instead of the existing one.
      - **Rename**, to save the restored object under a different name. In the entry field enter a new object's filename and full path to it.
      - **Rename by adding suffix**, to rename the object by adding a suffix to its filename. Enter suffix in the entry field.
   b. If you have selected several objects to be restored, then in order to apply the selected action, such as **Replace** or **Rename**, by adding suffix to the rest of the selected objects, select the **Apply to all selected objects** check box. (If you have selected the **Rename** value, the **Apply to all selected objects** check box will be unavailable).
   c. Click **OK**.

   The object will be restored. Information about the restoration operation will be entered into the system audit log.

   If you did not select option **Apply to all selected objects** in the **Restore object** window, the **Restore object** window will open again. Using this window you can specify the location into which next selected object will be saved (see Step 4 of this procedure).

**Deleting files from Backup**

> **To delete one or multiple files from Backup, take the following steps:**

1. In the Application Console tree, expand the **Storages** node.
2. Select the **Backup** child node.
3. Perform one of the following steps:
   - To remove one object, select **Remove** in the context menu of the name of the object.
   - To delete multiple objects, select the objects that you want to delete using the **Ctrl** or **Shift** key, open the context menu on any one of the selected objects and select **Remove**.

4. In the confirmation window, click the **Yes** button to confirm operation.

The selected files will be deleted from Backup.

**Configuring Backup settings**

To configure Backup settings, take the following steps:

1. In the Application Console tree, expand the **Storages** node.
2. Open the context menu of the **Backup** child node.
3. Select **Properties**.
4. In the **Backup Properties** window, configure the necessary Backup settings in accordance with your requirements:

In the **Backup settings** section:

- **Backup folder**
  
  Path to the Backup folder in UNC (Universal Naming Convention) format.
  The default path is C:\ProgramData\Kaspersky Lab\Kaspersky Security for Windows Server\10.1\Backup.

- **Maximum Backup size (MB)**
  
  This check box enables or disables the function that monitors the total size of objects stored in the Backup folder. If the specified value is exceeded (the default value being 200 MB), Kaspersky Security for Windows Server logs the **Maximum Backup size exceeded** event and issues a notification according to the settings for notifications about events of this type.
  
  If the check box is selected, Kaspersky Security for Windows Server monitors the total size of objects placed in Backup.
  
  If the check box is cleared, Kaspersky Security for Windows Server does not monitor the total size of objects placed in Backup.
  
  The check box is cleared by default.

- **Threshold value for space available (MB)**
  
  The check box enables or disables the function that monitors the minimum amount of free space in Backup (the default value being 50 MB). If the amount of free space decreases below the specified threshold, Kaspersky Security for Windows Server logs the **Backup free space threshold exceeded** event and issues a notification according to the settings for notifications about events of this type.
  
  If the check box is selected, Kaspersky Security for Windows Server monitors the amount of free space in Backup.
The Threshold value for space available (MB) check box is active if the Maximum Backup size (MB) check box is selected.

The check box is selected by default.

If the size of objects in Backup exceeds the maximum Backup size or exceeds the available space threshold, Kaspersky Security for Windows Server will notify you about this while continuing to place objects in Backup.

In the Restoration settings section:

- **Target folder for restoring objects**
  
  Path to the folder for restoring objects, in UNC (Universal Naming Convention) format.
  
  Default path: C:\Documents and Settings\All Users\Application Data\Kaspersky Lab\Kaspersky Security for Windows Server\10.1\Restored.

5. Click **OK**.

The configured Backup settings will be saved.

**Backup statistics**

You can view information about the current status of Backup: Backup statistics.

- **To view Backup statistics,**
  
  open the context menu on the Backup node in the Application Console tree and select **Statistics**. The Backup statistics window opens.

The Backup statistics window displays information about the current Backup status (see table below).

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Current Backup size</strong></td>
<td>Data size in the Backup folder; application calculates the file size in encrypted form</td>
</tr>
<tr>

</tbody>
</table>
About the Blocked Hosts storage

The Blocked Hosts storage is installed by default if any of the following components is installed: Real-Time File Protection, Anti-Cryptor for NetApp, Anti-Cryptor. These components discover remote hosts’ attempts to encrypt, open or execute objects on the protected server or network attached storage shared folders in accordance with the list of blocked hosts. Information about blocked hosts from all protected servers is sent to the Kaspersky Security Center. Kaspersky Security for Windows Server blocks access to server shared folders or network attached storage folders for all remote hosts in the list of blocked hosts.

The Blocked Hosts storage is populated, when at least one of the following tasks is started in an active mode; at that, the specified conditions are met:

- For the Real-Time File Protection task: malicious activity by a computer accessing network file resources is detected and in the Real-Time File Protection task settings the **Block access to network shared resources for the hosts that show malicious activity** check box is selected.
- For the Anti-Cryptor task: malicious encryption by a computer accessing network file resources is detected.
- For the Anti-Cryptor for NetApp task: an attack on the network attached storage is detected.

After the malicious activity or encryption attempt is detected, the task sends information about the attacking host to the Blocked Hosts storage and the application creates a warning event for the host blocking. Any attempts to access the protected shared network folders performed from this host will be blocked.

If the locally unique identifier (LUID) of an attacking host was added to the list of blocked hosts, Kaspersky Security for Windows Server determines the IP address of this host and adds this IP address to the list of blocked hosts instead of the LUID of the attacking host.

By default Kaspersky Security for Windows Server removes blocked hosts from the list in 30 minutes since they were added to the list. Computers’ access to network file resources is restored automatically after they are deleted from the list of blocked hosts. You can specify the period of time after which blocked hosts are automatically unblocked.

Note, that when you restrict access for managing storages for any user account, the Blocked Hosts storage will still be available. The Blocked Hosts settings cannot be changed, only if selected user account does not have **Edit permissions** for managing Kaspersky Security for Windows Server.

Enabling untrusted hosts blocking

To add hosts showing any malicious or encryption activity to the **Blocked Hosts** storage and block access to network file resources for those hosts, at least one of the following tasks must run in active mode:

- Real-Time File Protection
- Anti-Cryptor
- Anti-Cryptor for NetApp

**Configure the Real-Time File Protection task:**

1. In the Application Console tree, expand the **Real-Time Server Protection** node.
2. Select the **Real-Time File Protection** child node.
3. Click the **Properties** link in the details pane.
   The **Task settings** window opens.

4. In the **Integration with other components** section, select the **Block access to network shared resources for the hosts that show malicious activity** check box if you want Kaspersky Security for Windows Server to block hosts on which malicious activity is detected while the Real-Time File Protection task is running.

5. If the task has not been started, open the **Schedule** tab:
   a. Select the **Run by schedule** check box.
   b. Select the **At application launch** frequency in the drop-down list.

6. In the **Task settings** window, click **OK**.
   The newly configured settings are saved.

**Configure the Anti-Cryptor task:**

1. In the Application Console tree, expand the **Server Control** node.
2. Select the **Anti-Cryptor** child node.
3. Click the **Properties** link in the details pane.
   The **Task settings** window opens.
4. In the **General** tab, make sure that the task is in **Active** mode.
5. If the task has not been started, open the **Schedule** tab:
   a. Select the **Run by schedule** check box.
   b. Select the **At application launch** frequency in the drop-down list.
6. In the **Task settings** window, click **OK**.
   The newly configured settings are saved.

**Configure the Anti-Cryptor for NetApp task:**

1. In the Application Console tree, expand the **Network Attached Storage Protection** node.
2. Select the **Anti-Cryptor for NetApp** child node.
3. Click the **Properties** link in the details pane.
   The **Task settings** window opens.
4. In the **General** tab, make sure that the task is in **Active** mode.
5. If the task has not been started, open the **Schedule** tab:
   a. Select the **Run by schedule** check box.
   b. Select the **At application launch** frequency in the drop-down list.
6. In the **Task settings** window, click **OK**.
Kaspersky Security for Windows Server blocks access to network file resources for the hosts showing malicious or encrypting activity.
Configuring Blocked Hosts settings

To configure the Blocked Hosts storage:

1. In the Application Console tree, expand the Storages node.
2. Open the context menu of the Blocked Hosts child node.
3. Select the Properties menu option.
   The Blocked Hosts storage settings window is displayed.
4. In the Host blocking term section, specify the number of days, hours and minutes after which blocked hosts regain access to network file resources after being blocked.
5. Click OK.
6. To restore access for all blocked hosts:
   a. Open the context menu of the Blocked Hosts child node.
   b. Select the Unblock all option.
      All hosts will be removed from the list and unblocked.
7. To remove a number of hosts from the list of blocked hosts:
   a. In the list of blocked hosts, which is displayed in the details pane, select one or multiple hosts.
   b. Open the context menu of the Blocked Hosts child node.
   c. Select the Unblock selected option.
      The selected hosts are unblocked.
Event registration. Kaspersky Security for Windows Server logs

This section provides information about working with Kaspersky Security for Windows Server logs: the system audit log, task execution logs, and the event log.

In this chapter

| Ways to register Kaspersky Security for Windows Server events | 205 |
| System audit log | 206 |
| Task logs | 208 |
| Security log | 211 |
| Viewing the event log of Kaspersky Security for Windows Server in Event Viewer | 212 |
| Configuring log settings in Kaspersky Security for Windows Server Console | 212 |

Ways to register Kaspersky Security for Windows Server events

Events of Kaspersky Security for Windows Server are divided into two groups:

- Events related to the processing of objects in Kaspersky Security for Windows Server tasks.
- Events related to the administration of Kaspersky Security for Windows Server, such as start of application, creation or deletion of tasks, or edition of task settings.

Kaspersky Security for Windows Server uses the following methods of logging events:

- **Task logs.** A task log contains information about current task status and events that occurred during its execution.
- **System audit log.** The system audit log contains information about events that are related to the administration of Kaspersky Security for Windows Server.
- **Event Log.** The Event Log contains information about events that are required for diagnostics of failures in the operation of Kaspersky Security for Windows Server. The Event Log is available in Microsoft Windows Event Viewer.
- **Security log.** The Security log contains information about events that are associated with the security breaches or attempted security breaches on the protected server.

If a problem occurs during Kaspersky Security for Windows Server operation (for example, Kaspersky Security for Windows Server or an individual task terminates abnormally or does not start), you can create a trace file and memory dump of Kaspersky Security for Windows Server processes and send files with this information for analysis to Kaspersky Lab Technical Support in order to diagnose the problem encountered.

Kaspersky Security for Windows Server does not send any trace or dump files automatically. Diagnostics data can only be sent by the user with the corresponding permissions.
Kaspersky Security for Windows Server writes information to trace files and the dump file in unencrypted form. The folder where files are saved is selected by the user and managed by the operating system configuration and Kaspersky Security for Windows Server settings. You can configure access permissions (see Section "Managing access permissions for Kaspersky Security for Windows Server functions" on page 228) and allow access to logs, trace and dump files only for required users.

System audit log

Kaspersky Security for Windows Server performs the system audit of events related to the administration of Kaspersky Security for Windows Server. The application logs information about, for example, start of the application, starts and stops of Kaspersky Security for Windows Server tasks, changes in task settings, creation and deletion of On-Demand Scan tasks. Records of all those events are displayed in the details pane when you select the System audit log node in the Application Console.

By default Kaspersky Security for Windows Server stores records in the System audit log for an unlimited period of time. You specify the storage period for records in the System audit log.

You can specify a folder which Kaspersky Security for Windows Server will use to store files containing System audit log other than the default one.

In this section

Sorting events in the System audit log ................................................................. 206
Viewing the list of events in task logs ................................................................. 207
Filtering events in the System audit log .............................................................. 207
Deleting events from the system audit log ......................................................... 208

Sorting events in the System audit log

By default, events in the system audit log node are displayed in reverse chronological order.

Events can be sorted by the contents of any column except the Event column.

► To sort events in the System audit log:

1. In the Application Console tree, expand the Logs and notifications node.
2. Select the System audit log child node.
3. In the details pane, select the header of the column that you want to use to sort the events in the list.

The sorted results will be saved until your next viewing session in the System audit log.
Viewing the list of events in task logs

To view the list of events in task logs:

1. In the Application Console tree, expand the Logs and notifications node.
2. Select the Task logs subnode.

The list of events saved in task logs of Kaspersky Security for Windows Server will be displayed in the details pane.

Events can be sorted by any column or filtered.

Filtering events in the System audit log

You can configure the System audit log to display only the records of events that meet the filtering conditions (filters) that you have specified.

To filter events in the System audit log, take the following steps:

1. In the Application Console tree, expand the Logs and notifications node.
2. Open the context menu of the System audit log child node and select Filter.

The Filter settings window opens.

3. To add a filter, perform the following steps:
   a. In the Field name list, select a column by which events will be filtered.
   b. In the Operator list select the filtering condition. Filtering conditions vary depending on the item selected in the Field name list.
   c. In the Field value list, select a value for the filter.
   d. Click the Add button.

The filter you have added will appear in the list of filters in the Filter settings window.

4. If necessary, perform one of the following actions:
   - If you want to combine multiple filters using the logical operator "AND", select If all conditions are met.
   - If you want to combine multiple filters using the logical operator "OR", select If any condition is met.

5. Click the Apply button to save the filtering conditions in the system audit log.

The list of events of the System audit log displays only events that meet the filtering conditions. The filtering results will be saved until your next viewing session in the System audit log.

To disable the filter:

1. In the Application Console tree, expand the Logs and notifications node.
2. Open the context menu of the System audit log child node and select Remove filter.

The list of events of the System audit log will then display all events.
Deleting events from the system audit log

By default Kaspersky Security for Windows Server stores records in the system audit log for an unlimited period of time. You specify the storage period for records in the System audit log.

You can manually delete all events from System audit log.

► **To delete events from the System audit log:**

1. In the Application Console tree, expand the **Logs and notifications** node.
2. Open the context menu of the **System audit log** child node and select **Clear**.
3. Perform one of the following steps:
   - If you want to save the log contents as a file in CSV or TXT format before deleting events from the system audit log, click the **Yes** button in the deletion confirmation window. In the window that opens, specify the name and location of the file.
   - If you do not want to save the log contents as a file, click the **No** button in the deletion confirmation window.

The System audit log will be cleared.

Task logs

This section provides information about task logs of Kaspersky Security for Windows Server and instructions on how to manage them.

About task logs

Information about the execution of Kaspersky Security for Windows Server tasks is displayed in the details pane when you select the **Task logs** node in the Application Console.

In the log of each task, you can view the statistics of the task execution, details of each of the objects that have been processed by the application since the start of the task until the present moment, and the task settings.

By default, Kaspersky Security for Windows Server stores records in task logs during 30 days since the task completion. You can change the storage period for records in task logs.
You can specify a folder that Kaspersky Security for Windows Server will use to store files containing task logs other than the default one. You can also select events that Kaspersky Security for Windows Server will record into task logs.

**Sorting events in task logs**

By default, events in task logs are displayed in reverse chronological order. They can be sorted by any column.

► *To sort events in task logs:*

1. In the Application Console tree, expand the **Logs and notifications** node.
2. Select the **Task logs** subnode.
3. In the details pane, select the header of the column that you want to use to sort events in task logs of Kaspersky Security for Windows Server.

The sorted results will be saved until your next viewing session in the task logs.

**Filtering events in task logs**

You can configure the list of task logs to display only the records of events that meet the filtering conditions (filters) that you have specified.

► *To filter events in the task logs:*

1. In the Application Console tree, expand the **Logs and notifications** node.
2. Open the context menu of the **Task logs** child node and select **Filter**.
   
   The **Filter settings** window opens.
3. To add a filter, perform the following steps:
   
   a. In the **Field name** list, select a column by which events will be filtered.
   b. In the **Operator** list select the filtering condition. Filtering conditions vary depending on the item selected in the **Field name** list.
   c. In the **Field value** list, select a value for the filter.
   d. Click the **Add** button.

   The filter you have added will appear in the list of filters in the **Filter settings** window.
4. If necessary, perform one of the following actions:
   
   • If you want to combine multiple filters using the logical operator "AND", select **If all conditions are met**.
   • If you want to combine multiple filters using the logical operator "OR", select **If any condition is met**.
5. Click the **Apply** button to save the filtering conditions in the list of task logs.

The list of events of task logs displays only events that meet the filtering conditions. The filtered results will be saved until your next viewing session in the task logs.
To disable the filter:

1. In the Application Console tree, expand the Logs and notifications node.
2. Open the context menu of the Task logs child node and select Remove filter.

The list of events of the task logs will then display all events.

Viewing statistics and information about a Kaspersky Security for Windows Server task in task logs

In task logs, you can view detailed information about all events that have occurred in tasks since they had been started until the present moment, as well as task execution statistics and task settings.

To view statistics and information about a Kaspersky Security for Windows Server task:

1. In the Application Console tree, expand the Logs and notifications node.
2. Select the Task logs subnode.
3. In the results pane, open the Logs window using one of the following methods:
   - By double-clicking the event that has occurred in the task for which you want to view the log.
   - Open the context menu of the event that has occurred in the task for which you want to view the log, and select View log.
4. In the window that opens, the following details are displayed:
   - The Statistics tab displays the time of the task start and completion, as well as the task statistics.
   - The Events tab displays a list of events that have been logged during the task run.
   - The Options tab displays the task settings.
5. If necessary, click the Filter button to filter the events in the task log.
6. If necessary, click the Export button to export data from the task log into a file in CSV or TXT format.
7. Press the Close button.

The Logs window will be closed.

Exporting information from a task log

You can export data from a task log into a file in CSV or TXT format.

To export data from a task log:

1. In the Application Console tree, expand the Logs and notifications node.
2. Select the Task logs subnode.
3. In the results pane, open the Logs window using one of the following methods:
   - By double-clicking the event that has occurred in the task for which you want to view the log.
   - Open the context menu of the event that has occurred in the task for which you want to view the log, and select View log.
4. In the lower part of the Logs window, click the Export button.
   The Save as window opens.

5. Specify the name, location, type, and encoding of the file into which you want to export data from the task log.

6. Click the Save button.
   The specified settings are saved.

Deleting events from task logs

By default, Kaspersky Security for Windows Server stores records in task logs during 30 days since the task completion. You can change the storage period for records in task logs.

You can manually delete all events from logs of tasks that have been already completed for the present moment.

Events from logs of tasks that are currently running and tasks being used by other users will not be deleted.

► To delete the events from task logs:

1. In the Application Console tree, expand the Logs and notifications node.

2. Select the Task logs subnode.

3. Perform one of the following steps:
   • If you want to delete the events from the logs of all tasks that have been already completed for the present moment, open the context menu of the Task logs child node and select Clear.
   • If you want to clear the log of an individual task, in the details pane, open the context menu of an event that has occurred in the task for which you want to clear the log, and select Remove.
   • If you want to clear the logs for several tasks:
     a. In the details pane, use the Ctrl or Shift keys to select events that have occurred in the tasks for which you want to clear the logs.
     b. Open the context menu of any selected event and select Remove.

4. Click the Yes button in the deletion confirmation window to confirm that you want to delete the logs.
   The task logs that you have selected will be cleared. The deletion of events from the task logs will be registered with the system audit log.

Security log

Kaspersky Security for Windows Server maintains a log of events associated with security breaches or attempted security breaches on the protected server. The following events are recorded in this log:

• Exploit Prevention events.
• Critical Log Inspection events.
• Critical events that indicate an attempted security breach (for the Real-Time Server Protection, On-Demand Scan, File Integrity Monitor, Applications Launch Control, and Device Control tasks).
You can clear the Security log as well as the System audit log (see Section “Deleting events from the system audit log” on page 208). Moreover, Kaspersky Security for Windows Server records system audit events regarding clearing the Security log.

### Viewing the event log of Kaspersky Security for Windows Server in Event Viewer

Events that will be registered in the events log can be selected based on the following criteria:

- **by event types**
- **by level of detail.** The level of detail corresponds to the importance level of the events registered in the log (informational, important, or critical events). The most detailed is the Informational events level, which registers all events, and the least detailed is the Critical events level, which registers critical events only. By default, all components except for the Update component have the level of detail Important events selected (only important and critical events are logged); for the Update component the level Informational events is selected.

▲ *To view the Kaspersky Security for Windows Server event log:*

1. Click the **Start** button, enter the `mmc` command at the search bar, and press **ENTER**.
   The window of Microsoft Management Console opens.
2. Select **File > Add or remove snap-in.**
   The **Add or remove snap-ins** window opens.
3. In the list of available snap-ins, select the **Event Viewer snap-in** and click the **Add** button.
   The **Select computer** window opens.
4. In the **Select computer** window, specify the computer on which Kaspersky Security for Windows Server is installed, and click **OK**.
5. In the **Add and remove snap-ins** window, click **OK**.
   In the Microsoft Management Console tree, the **Event Viewer** node appears.
6. Expand the **Event Viewer** node and select the **Applications and Services Logs > Kaspersky Security for Windows Server** child node.
   The Kaspersky Security for Windows Server event log opens.

### Configuring log settings in Kaspersky Security for Windows Server Console

You can edit the following settings of logs of Kaspersky Security for Windows Server:

- Length of the storage period for events in task logs and the system audit log.
- Location of the folder in which Kaspersky Security for Windows Server stores files of task logs and the system audit log.
Events generation thresholds for Application database is out of date, Application database is extremely out of date, and Critical Areas Scan has not been performed for a long time.

Events that Kaspersky Security for Windows Server saves in task logs, the system audit log, and the event log of Kaspersky Security for Windows Server in Event Viewer.

Settings for publishing audit events and task performance events to the syslog server via the Syslog protocol.

To configure Kaspersky Security for Windows Server logs, perform the following steps:

1. In the Application Console tree, open the context menu of the Logs and Notifications node and select Properties.
   The Logs and Notifications settings window opens.

2. In the Logs and notifications settings window, configure the logs in accordance with your requirements.
   To do this, perform the following actions:
   • On the General tab, if necessary, select events that Kaspersky Security for Windows Server will save in task logs, the system audit log, and the event log of Kaspersky Security for Windows Server in Event Viewer. To do this, perform the following actions:
     • In the Component list, select the component of Kaspersky Security for Windows Server for which you want to set the detail level.
     For the Real-Time File Protection, RPC Network Storage Protection, ICAP Network Storage Protection, Script Monitoring, On-Demand Scan, and Update components, registration of events via tasks logs and the event log is provided. For these components, the table of event list contains the Task log and Windows Event Log columns. Events for the Quarantine and Backup components are registered in the system audit log and the event log. For these components, the table of event list contains the Audit and Windows Event Log columns.
   • In the Importance level list, select a detail level for events in task logs, the system audit log, and the event log for the selected component.
     In the following table with a list of events, the check boxes are selected next to events that are registered with task logs, the system audit log, and the event log, according to the current detail level.
     • If you want to manually enable registration of specific events for a selected component, perform the following actions:
       a. In the Importance level list, select Custom.
       b. In the table with the list of events, select the check boxes next to events that you want to be registered in task logs, the system audit log, and the event log.

   • On the Advanced tab, configure the log storage settings and event generation thresholds for server protection status:
     • In the Log storage section:
       • Logs folder
         Path to the log folder in UNC (Universal Naming Convention) format.
         Default path: C:\ProgramData\Kaspersky Lab\Kaspersky Security for Windows Server\10.1\Reports\.
If the default path is changed, a folder with corresponding name is created. The new logs will be stored in the new folder. The old logs will be preserved.

- **Remove task logs older than (days)**

  The check box enables / disables a function that deletes logs with the results of execution of completed tasks and events published in logs of running tasks after the specified period of time (default value: 30 days).

  If the check box is selected, Kaspersky Security for Windows Server deletes logs with the results of execution of completed tasks and events published in logs of running tasks after the specified period of time.

  The check box is selected by default.

- **Remove from the system audit log events older than (days)**

  The check box enables / disables a function that deletes events recorded in the system audit log after the specified period of time (default value: 60 days).

  If the check box is selected, Kaspersky Security for Windows Server deletes events recorded in the system audit log after the specified period of time.

  The check box is cleared by default.

- **In the Event generation thresholds section:**

  - Specify the number of days after which the events *Application database is out of date*, *Application database is extremely out of date* and *Critical Areas Scan has not been performed for a long time* will occur.

**Table 36. Event generation thresholds**

<table>
<thead>
<tr>
<th>Setting</th>
<th>Event generation thresholds.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Description</strong></td>
<td>You can specify thresholds for generation of the following event types: <em>Application database is out of date</em> and <em>Application database is extremely out of date</em>. This event occurs if Kaspersky Security for Windows Server database has not been updated during the period (in days) specified by the setting since the release date of the most recently installed database updates. You can configure administrator notifications about this event. <em>Critical Areas Scan has not been performed for a long time</em>. This event occurs if none of the tasks marked with the <strong>Consider task as Critical Areas Scan</strong> check box are performed during the specified number of days.</td>
</tr>
<tr>
<td><strong>Possible values</strong></td>
<td>Number of days from 1 to 365.</td>

</table>

- On the **SIEM integration** tab, configure the settings for publishing audit events and task performance events to the syslog server (see Section “Configuring SIEM integration settings” on page 216).

3. Click **OK** to save the changes.
In this section

About SIEM integration ........................................................................................................................................ 215
Configuring SIEM integration settings ............................................................................................................ 216

About SIEM integration

To reduce the load on low-performance devices and to reduce the risk of system degradation as a result of increased volumes of application logs, you can configure the publication of audit events and task performance events to the syslog server via the Syslog protocol.

A syslog server is an external server for aggregating events (SIEM). It collects and analyzes received events and also performs other actions for managing logs.

You can use SIEM integration in two modes:

- Duplicate events on the syslog server: this mode prescribes that all task performance events whose publication is configured in the settings of logs as well as all system audit events continue to be stored on the local computer even after they are sent to SIEM.
  
  It is recommended to use this mode to maximally reduce the load on the protected server.

- Delete local copies of events: this mode prescribes that all events that are registered during application operation and published to SIEM will be deleted from the local computer.

  The application never deletes local versions of the security log.

Kaspersky Security for Windows Server can convert events in application logs into formats supported by the syslog server so that those events can be transmitted and successfully recognized by SIEM. The application supports conversion into structured data format and into JSON format.

It is recommended to select the format of events based on the configuration of the utilized SIEM.

Reliability settings

You can reduce the risk of unsuccessful relay of events to SIEM by defining the settings for connecting to the mirror syslog server.

A mirror syslog server is an additional syslog server to which the application switches automatically if the connection to the main syslog server is unavailable or if the main server cannot be used.

Kaspersky Security for Windows Server also notifies you about unsuccessful attempts to connect to SIEM and about errors sending events to SIEM using system audit events.
Configuring SIEM integration settings

By default, SIEM integration is not used. You can enable and disable SIEM integration, and configure functionality settings (see the table below).

Table 37. SIEM integration settings

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

To configure SIEM integration settings:

1. In the Application Console tree, open the context menu of the Logs and Notifications node.
2. Select Properties.
   The Logs and notifications settings window opens.
3. Select the SIEM integration tab.
4. In the Integration settings section, select the Send events to a remote syslog server via syslog protocol check box.
   The check box enables or disables the functionality for sending published events to an external syslog server.
If the check box is selected, the application sends published events to SIEM according to the configured SIEM integration settings.

If the check box is cleared, the application does not perform SIEM integration. You cannot configure SIEM integration settings if the check box is cleared.

The check box is cleared by default.

5. If necessary, in the Integration settings section, select the Remove local copies for events that have been sent to a remote syslog server check box.

The check box enables or disables deletion of local copies of logs when they are sent to SIEM.

If the check box is selected, the application deletes the local copies of events after they have been successfully published to SIEM. This mode is recommended on low-performance computers.

If the check box is cleared, the application only sends events to SIEM. Copies of logs continue to be stored locally.

The check box is cleared by default.

The status of the Remove local copies for events that have been sent to a remote syslog server check box does not affect the settings for storing events of the security log: the application never automatically deletes security log events.

6. In the Events format section, specify the format to which you want to convert application operation events so that they can be sent to SIEM.

By default, the application converts them into structured data format.

7. In the Connection settings section:
   - Specify the SIEM connection protocol.
   - Specify the settings for connecting to the main syslog server.
     You can specify an IP address in IPv4 format only.
   - Select the Use mirror syslog server if the main server is not accessible check box if you want the application to use other connection settings when unable to send events to the main syslog server.
     Specify the following settings for connecting to the mirror syslog server: IP address and Port.
     The IP address and Port fields for the mirror syslog server cannot be edited if the Use mirror syslog server if the main server is not accessible check box is cleared.
     You can specify an IP address in IPv4 format only.

8. Click OK.

The configured SIEM integration settings will be applied.
Notification settings

This section provides information about ways in which users and administrators of Kaspersky Security for Windows Server can be notified about application events and the server protection status, as well as instructions on how to configure notifications.

In this chapter

<table>
<thead>
<tr>
<th>Administrator and user notification methods</th>
<th>218</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configuring administrator and user notifications</td>
<td>219</td>
</tr>
</tbody>
</table>

Administrator and user notification methods

You can configure the application to notify the administrator and users who access the protected server about events in Kaspersky Security for Windows Server operation and the status of Anti-Virus protection on the server.

The application ensures performance of the following tasks:

- The administrator can receive information about events of selected types.
- LAN users who access a protected server and terminal server users can receive information about events of the type Object detected in the Real-Time File Protection task.

In the Application Console, administrator or user notifications can be activated using several methods:

- User notification methods:
  - Terminal service tools.
    - You can apply this method for notifying terminal server users if the protected server is used as terminal.
  - Message service tools.
    - You can apply this method for notification via Microsoft Windows message services. The method is not applicable if the protected server is running Microsoft Windows Server 2008 or higher.

- Administrator notification methods:
  - Message service tools.
    - You can apply this method for notification via Microsoft Windows message services. The method is not applicable if the protected server is running Microsoft Windows Server 2008 or higher.
  - Running an executable file.
    - This method runs an executable file stored on the local drive of the protected server, when the event occurs.
  - Sending by email.
    - This method uses email to transmit messages.

You can create a message text for individual event types. It can include an information field to describe an event. By default, the application uses a predefined text to notify users.
Configuring administrator and user notifications

Event notification settings give you a choice of methods for configuring and composing a message text.

To configure event notification settings, take the following steps:

1. In the Application Console tree, open the context menu of the Logs and notifications node and select Properties.

   The Logs and notifications settings window opens.

2. On the Notifications tab select the notification mode:
   a. Select the event for which you wish to select a notification method from the Event type list.
   b. In the Notify administrators or Notify users group settings, select the check box next to the notification methods that you wish to configure.

   You can configure user notifications for the Object detected event, Untrusted mass storage detected and restricted event, and Host listed as untrusted event only.

3. To add the text of a message:
   a. Click the Message text button.
   b. In the window that opens, enter text to be displayed in the corresponding event message.

   You can create one message text for several event types: after you have selected a notification method for one event type, select the other event types for which you want to use the same message text by using the Ctrl or Shift key, and then click the Message text button.

   c. To add fields with information about an event, click the Macro button and select the relevant fields from the drop-down list. Fields with event information are described in the table in this section.
   d. To restore the default event message text, click the By default button.

4. To configure the selected methods of administrator notification of selected event, select the Notifications tab, click the Settings button in the Notify administrators section and configure the selected methods in the Advanced settings window. To do this, perform the following actions:
   a. For email notifications, open the Email tab and specify the email addresses of recipients (delimit addresses with semicolon), name or network address of SMTP server, and port number in the appropriate fields. If necessary, specify the text that will be displayed in the Subject and From fields. The text in the Subject field can also include variables with information about the event (see table below).

   If you want to apply user account authentication when connecting to the SMTP server, select Use SMTP authentication in the Authentication settings group and specify the name and password of the user whose user account will be authenticated.

   b. For notifications using Windows Messenger Service create a list of recipient computers for notifications on the Windows Messenger Service tab: for each computer that you wish to add, press the Add button and enter its network name in the input field.
c. To run an executable file, select the file on a local drive of the protected server that will be executed on the server triggered by the event or enter the full path to it on the **Executable file** tab. Enter the user name and password which will be used to execute the file.

System environment variables can be used when the path to the executable file is specified; user environment variables are not allowed.

If you wish to limit the number of messages for one event type over a period of time, on the **Advanced** tab select **Do not send the same notification more than** and specify the number of times and time unit.

5. Click **OK**.

The configured notification settings are saved.

Starting and stopping Kaspersky Security for Windows Server

This section contains information about starting Application Console, and also about starting and stopping Kaspersky Security Service.

In this chapter

- Starting the Kaspersky Security for Windows Server Administration Plug-in...................................................... 222
- Starting the Kaspersky Security for Windows Server Console from Start menu.......................................................... 222
- Starting and stopping Kaspersky Security Service........................................................................................................... 223
- Starting the Kaspersky Security for Windows Server components in the operating system safe mode... 224

Starting the Kaspersky Security for Windows Server Administration Plug-in

No additional actions are required to start the Kaspersky Security for Windows Server Administration Plug-in in Kaspersky Security Center. After the Plug-in is installed on the administrator's computer, it is started simultaneously with Kaspersky Security Center. Detailed information about starting Kaspersky Security Center can be found in the Kaspersky Security Center Help.

Starting the Kaspersky Security for Windows Server Console from Start menu

The names of settings may vary under different Windows operating systems.

► To start the Application Console from the Start menu:

To add other snap-ins to the Application Console, start the Application Console in author mode.

► To start the Application Console in author mode, take the following steps:

1. In the Start menu, select Programs > Kaspersky Security for Windows Server > Administration Tools.
2. In the context menu of the Application Console, select the Author command.

The Application Console is started in author mode.

If the Application Console has been started on the protected server, the Application Console window opens.
If you have started the Application Console not on a protected server but on a different one, connect to the protected server.

► To connect to a protected server:

1. In the Application Console tree, open the context menu of the Kaspersky Security node.
2. Select the Connect to another computer command.
   The Select computer window opens.
3. Select Another computer in the window that opens.
4. Specify the network name of the protected server in the entry field on the right.
5. Click OK.
   The Application Console will be connected to a protected server.

If the user account that you are using to log in to Microsoft Windows does not have sufficient permissions to access Kaspersky Security Management Service on the server, select the Connect as user check box and specify a different user account that has such permissions.

Starting and stopping Kaspersky Security Service

By default, Kaspersky Security Service starts automatically immediately after the operating system. Kaspersky Security Service manages working processes in which Real-Time Server Protection, Server Control, On-Demand Scan and update tasks are executed.

By default when Kaspersky Security for Windows Server is started, the Real-Time File Protection, Script Monitoring (if installed) and Scan at Operating System Startup tasks are started, as well as other tasks that are scheduled to start At application launch.

If the Kaspersky Security Service is stopped, all running tasks are stopped. After you restart Kaspersky Security Service, the application automatically starts only those tasks whose schedule has the launch frequency set to At application launch, while the other tasks have to be started manually.

You can start and stop Kaspersky Security Service using the context menu of the Kaspersky Security node or using the Microsoft Windows Services snap-in.

You can start and stop Kaspersky Security for Windows Server if you are a member of the Administrators group on the protected server.

► To stop or start application using the Application Console take the following steps:

1. In the Application Console tree, open the context menu of the Kaspersky Security node.
2. Select one of the following items:
   • Stop the service.
   • Start the service.
   The Kaspersky Security Service will be started or stopped.
Starting the Kaspersky Security for Windows Server components in the operating system safe mode

This section provides information about Kaspersky Security for Windows Server working in the operating system safe mode.

In this chapter

<table>
<thead>
<tr>
<th>About Kaspersky Security for Windows Server working in the operating system safe mode</th>
<th>224</th>
</tr>
</thead>
<tbody>
<tr>
<td>Starting Kaspersky Security for Windows Server in safe mode</td>
<td>225</td>
</tr>
</tbody>
</table>

About Kaspersky Security for Windows Server working in the operating system safe mode

Kaspersky Security for Windows Server components can be started upon loading of the operating system in safe mode. Besides Kaspersky Security Service (kavlfs.exe), klam.sys driver is loaded, which is used for registering Kaspersky Security service as a protected service during the start of the operating system. For more details, see section Registering the Kaspersky Security Service as a protected service.

Kaspersky Security for Windows Server can be started in the following safe modes of the operating system:

- Safe Mode Minimal – this mode is started when the standard option of the operating system safe mode is selected. At that, Kaspersky Security for Windows Server can start the following components:
  - Real-Time File Protection.
  - On-Demand Scan.
  - Applications Launch Control and Rule Generator for Applications Launch Control.
  - Log Inspection.
  - File Integrity Monitor.
  - Application Integrity Control.
  - Anti-Cryptor.
  - Blocked Hosts storage.

- Safe Mode Network – this mode is started when the operating system is loaded in safe mode with network drivers. Besides the components starting in Safe Mode Minimal, Kaspersky Security for Windows Server can start the following components:
  - Updating databases.
  - Updating software modules.
  - Network Attached Storage Protection.
Starting Kaspersky Security for Windows Server in safe mode

By default, Kaspersky Security for Windows Server is not started upon loading of the operating system in safe mode.

► To make Kaspersky Security for Windows Server start in the operating system safe mode, perform the following actions:

1. Start Windows registry editor (C:\Windows\regedit.exe).
2. Open the [HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\klam\Parameters] key of the system registry.
3. Open LoadInSafeMode parameter.
4. Set value 1.
5. Click OK.

► To cancel start of Kaspersky Security for Windows Server in the operating system safe mode, perform the following actions:

1. Start Windows registry editor (C:\Windows\regedit.exe).
2. Open the [HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\klam\Parameters] key of the system registry.
3. Open LoadInSafeMode parameter.
4. Set value 0.
5. Click OK.
Kaspersky Security for Windows Server self-defense

This section provides information about Kaspersky Security for Windows Server self-defense mechanisms.

In this chapter

About Kaspersky Security for Windows Server self-defense ........................................... 226
Protection from changes of folders with installed Kaspersky Security for Windows Server components. 226
Protection from changes of Kaspersky Security for Windows Server registry keys ........................................ 226
Registering the Kaspersky Security Service as a protected service ........................................... 227
Managing access permissions for Kaspersky Security for Windows Server functions ......................... 228

About Kaspersky Security for Windows Server self-defense

Kaspersky Security for Windows Server comprises self-defense mechanisms that protect the application against modification or deletion of its folders on the hard drive, memory processes, and system registry entries.

Protection from changes of folders with installed Kaspersky Security for Windows Server components

Kaspersky Security for Windows Server restricts renaming and deletion of folders with the installed application components for any user account. By default, the paths to the application installation folders are as follows:

- On the 32-bit version of Microsoft Windows: %ProgramFiles%\Kaspersky Lab\Kaspersky Security for Windows Server\n
- On the 64-bit version of Microsoft Windows: %ProgramFiles(x86)%\Kaspersky Lab\Kaspersky Security for Windows Server\n
Protection from changes of Kaspersky Security for Windows Server registry keys

Kaspersky Security for Windows Server restricts rights of access to the following registry branches and keys, which provide loading of the application drivers and services:

- [HKEY_LOCAL_MACHINE\SOFTWARE\Wow6432Node\KasperskyLab\WSEE]
- [HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\kavfs]
- [HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\kavfsgt]
- [HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\kavfssl]

Kaspersky Security for Windows Server self-defense 226
Registering the Kaspersky Security Service as a protected service

Protected Process Light (also referred to as "PPL") technology ensures that the operating system only loads trusted services and processes. For a service to run as a protected service, an Early Launch Antimalware driver must be installed on the protected server.

An Early Launch Antimalware (also referred to as "ELAM") driver provides protection for the servers in your network when they start and before third-party drivers are initialized.

The ELAM driver is automatically installed during the Kaspersky Security for Windows Server installation and is used for registering the Kaspersky Security Service as PPL when the operating system starts. When the Kaspersky Security Service (KAVFS) is started as a system protected process, other non-protected processes on the system are not able to inject threads, write into the virtual memory of the protected process, or stop the service.

When a process is started as PPL, it cannot be managed by user disregarding the assigned user permissions. The Kaspersky Security Service registration as PPL using the ELAM driver is supported on the Microsoft Windows Server 2016 and higher operating systems. If you install Kaspersky Security for Windows Server on a server running PPL-supporting operating system, the permission management for Kaspersky Security Service (KAVFS) will not be available.

To install Kaspersky Security as PPL, run the following command:

```
msiexec /i ks4ws_x64.msi NOPPL=0 EULA=1 PRIVACYPOLICY=1 /qn
```
Managing access permissions for Kaspersky Security for Windows Server functions

This section contains information about permissions to manage Kaspersky Security for Windows Server and Windows services registered by the application, and instructions on how to configure these permissions.

In this chapter

About permissions to manage Kaspersky Security for Windows Server .......................................................... 228
About permissions to manage registered services ........................................................................................................ 230
About permissions to manage the Kaspersky Security Service .................................................................................... 230
About access permissions for the Kaspersky Security Management Service ................................................................. 232
Password-protected access to Kaspersky Security for Windows Server functions ......................................................... 234
Configuring access permissions in Kaspersky Security Center ...................................................................................... 235

About permissions to manage Kaspersky Security for Windows Server

By default, access to all Kaspersky Security for Windows Server functions is granted to users of the Administrators group on the protected server, users of the KAVWSEE Administrators group created on the protected server during installation of Kaspersky Security for Windows Server, and the SYSTEM group.

Users who have access to the Edit permissions function of Kaspersky Security for Windows Server can grant access to Kaspersky Security for Windows Server functions to other users registered on the protected server or included in the domain.

Users who are not registered in the list of Kaspersky Security for Windows Server users cannot open the Application Console.

You can choose one of the following preset access levels for a user or group of users:

- Full control – access to all application functions: the ability to view and edit Kaspersky Security for Windows Server general settings, component settings, and Kaspersky Security for Windows Server user permissions; and the ability to view Kaspersky Security for Windows Server statistics.

You can also configure advanced access permissions: allow or block access to specific functions of Kaspersky Security for Windows Server.
If you have manually configured access permissions for a user or group, then the **Special permissions** access level is set for this user or group.

About permissions to manage registered services

Detailed information about registered Windows services and how to configure access to registered services is contained in Kaspersky Security for Windows Server Administrator's Guide.

The Kaspersky Security Service registration as a Protected Process Light using the ELAM driver is supported on the Microsoft Windows 10 and higher operating systems. When a process is started as PPL, it cannot be managed by user disregarding the assigned user permissions. If you install Kaspersky Security for Windows Server on a computer running PPL-supporting operating system, the permission management for Kaspersky Security Service (KAVFS) will not be available.

Kaspersky Security Service

By default, access permissions for managing the Kaspersky Security Service are granted to users in the "Administrators" group on the protected server as well as to the SERVICE and INTERACTIVE groups with read permissions and to the SYSTEM group with read and execute permissions.

Users who have access to functions of the Edit permissions level (see Section "Password-protected access to Kaspersky Security for Windows Server functions" on page 234) can grant access permissions for managing Kaspersky Security Service to other users registered on the protected server or included in the domain.

Kaspersky Security Management Service

To manage the application via the Application Console installed on a different server, the account whose permissions are used to connect to Kaspersky Security for Windows Server must have full access to Kaspersky Security Management Service on the protected server.

By default, access to the Kaspersky Security Management Service is granted to users of the Administrators group on the protected server and users of the KAVWSEE Administrators group created on the protected server during Kaspersky Security for Windows Server installation.

You can only manage the Kaspersky Security Management Service via the Microsoft Windows Services snap-in.

About permissions to manage the Kaspersky Security Service

During installation, Kaspersky Security for Windows Server registers Kaspersky Security Service (KAVFS) in Windows, and internally enables functional components started at operating system startup. To reduce the risk of third-party access to application functions and security settings on the protected server through management of the Kaspersky Security Service, you can restrict permissions for managing the Kaspersky Security Service from the Application Console or the Administration Plug-in.

By default, access permissions for managing the Kaspersky Security Service are granted to users in the "Administrators" group on the protected server as well as to the SERVICE and INTERACTIVE groups with read permissions and to the SYSTEM group with read and execute permissions.
You cannot delete the SYSTEM user account or edit permissions for this account. If the SYSTEM user account permissions were edited, the maximum privileges are restored for this account when you save the changes.

Users who have access to functions (see Section “About permissions to manage Kaspersky Security for Windows Server” on page 228) of the Edit permissions level can grant access permissions for managing Kaspersky Security Service to other users registered on the protected server or included in the domain.

You can choose one of the following preset levels of access permissions for a user or group of users of Kaspersky Security for Windows Server for managing Kaspersky Security Service:

- **Full control**: ability to view and edit general settings and user permissions for the Kaspersky Security Service, and to start and stop the Kaspersky Security Service.
- **Read**: ability to view Kaspersky Security Service general settings and user permissions.
- **Modification**: ability to view and edit Kaspersky Security Service general settings and user permissions.
- **Execution**: ability to start and stop the Kaspersky Security Service.

You can also configure advanced access permissions: allow or deny access to specific Kaspersky Security for Windows Server functions (see the table below).

If you have manually configured access permissions for a user or group, then the **Special permissions** access level is set for this user or group.

**About access permissions for the Kaspersky Security Management Service**

You can review the list of Kaspersky Security for Windows Server services.

During installation, Kaspersky Security for Windows Server registers the Kaspersky Security Management Service (KAVFSGT). To manage the application via the Application Console installed on a different computer, the account used to connect to Kaspersky Security for Windows Server must have full access to the Kaspersky Security Management Service on the protected server.

By default, access to the Kaspersky Security Management Service is granted to users of the Administrators group on the protected server and users of the KAVWSEE Administrators group created on the protected server during installation of Kaspersky Security for Windows Server.

You can manage the Kaspersky Security Management Service only via the Microsoft Windows Services snap-in.

You cannot allow or block user access to the Kaspersky Security Management Service by configuring Kaspersky Security for Windows Server.

You can connect to Kaspersky Security for Windows Server from a local account if an account with the same user name and password is registered on the protected server.

**Configuring access permissions for managing Kaspersky Security for Windows Server and Kaspersky Security Service**

You can edit the list of users and user groups allowed to access Kaspersky Security for Windows Server functions and manage Kaspersky Security Service, and also edit the access permissions of those users and user groups.
To add or remove a user or group from the list:

1. In the Application Console tree, open the context menu of the **Kaspersky Security** node and do one of the following:
   - Select **Modify user rights of application management** if you want to edit the list of users who have access permissions for managing Kaspersky Security for Windows Server functions.
   - Select **Modify user rights of Kaspersky Security Service management** if you want to edit the list of users who have access permissions for the Kaspersky Security Service.
     
     The Permissions for Kaspersky Security window opens.

2. In the window that opens, perform the following operations:
   - In order to add a user or group to the list, click the **Add** button and select the user or group.
   - To remove a user or group from the list, select the user or group and click the **Remove** button.

3. Click the **Apply** button.

   The selected users (groups) are added or removed.

To edit permissions of a user or group to manage Kaspersky Security for Windows Server or Kaspersky Security Service:

1. In the Application Console tree, open the context menu of the **Kaspersky Security** node and do one of the following:
   - Select **Modify user rights of application management** if you want to configure access permissions for Kaspersky Security for Windows Server functions.
   - Select **Modify user rights of Kaspersky Security Service management** if you want to configure access permissions for the Kaspersky Security Service.
     
     The Permissions for Kaspersky Security window opens.

2. In the window that opens, in the **Group or user names** list select the user or group of users for whom you want to change permissions.

3. In the **Permissions for group”<User (Group)>”** section, select the **Allow** or **Deny** check boxes for the following access levels:
   - Click **Settings** in the **Modify user rights of application management** subsection if you want to edit the list of users who have access permissions for managing Kaspersky Security for Windows Server functions.
   - Click **Settings** in the **Modify user rights of Kaspersky Security Service management** subsection if you want to edit the list of users who have access permissions for managing the application via the Kaspersky Security Service.
     
     The Permissions for Kaspersky Security group window opens.

4. In the window that opens, in the **Group or user names** list, select the user or group of users whose permissions you want to change.
5. In the Permissions for <User (Group)> section, select the Allow or Deny check boxes for the following access levels:

- **Full control**: full set of permissions to manage Kaspersky Security for Windows Server or the Kaspersky Security Service.

- **Read**:
  - The following permissions to manage Kaspersky Security for Windows Server: Retrieve statistics, Read settings, Read logs and Read permissions.
  - The following permissions to manage the Kaspersky Security Service: Read service settings, Request service status from Service Control Manager, Request status from service, Read list of dependent services, Read permissions.

- **Modification**:
  - All permissions to manage Kaspersky Security for Windows Server, except Edit permissions.
  - The following permissions to manage Kaspersky Security Service: Modify service settings, Read permissions.

- **Special permissions**: the following permissions to manage the Kaspersky Security Service: Start service, Stop service, Pause / Resume service, Read permissions, User defined requests to service.

6. To configure advanced permissions for a user or group (Special permissions), click the Advanced button.
   a. In the Advanced security settings for Kaspersky Security for Windows Server window that opens, select the desired user or group.
   b. Click the Edit button.
   c. In the drop-down list in the top part of the window, select the type of access control (Allow or Block).
   d. Select the check boxes next to the functions that you want to allow or block for the selected user or group.
   e. Click OK.
   f. In the Advanced security settings for Kaspersky Security for Windows Server window, click OK.

7. In the Permissions for Kaspersky Security group window, click the Apply button.

The configured permissions for managing Kaspersky Security for Windows Server or the Kaspersky Security Service are saved.

**Password-protected access to Kaspersky Security for Windows Server functions**

You can restrict access to application management and registered services by configuring user permissions (see Section "Managing access permissions for Kaspersky Security for Windows Server functions" on page 228). You can also set password protection in the Kaspersky Security for Windows Server settings for additional protection. Password protection allows you to additionally limit access to the Application Console management and execution of the command line commands. If the password protection is applied, Kaspersky Security for Windows Server requires all users to enter the password when starting the Application Console or executing command line commands.
To protect access to Kaspersky Security for Windows Server functions:

1. In the Application Console tree, select the Kaspersky Security node and do one of the following:
   - Click the Application properties link in the details pane of the node.
   - Select Properties in the node’s context menu.

   The Application settings window opens.

2. On the Security and reliability tab in the Password protection settings click the Apply password protection check box.

   The Password and Confirm password fields become active.

3. In the Password field, enter the value you want to use to protect access to Kaspersky Security for Windows Server functions.

4. In the Confirm password field, enter your password again.

5. Click OK.

This password cannot be recovered. Losing your password results in complete loss of control of the application. Additionally, it will be impossible to uninstall the application from the protected server.

You can reset the password at any time. To do that, clear the Apply password protection check box and save changes. Password protection will be disabled and old password checksum removed. Repeat the password entering process with a new password.

Configuring access permissions in Kaspersky Security Center

You can configure access permissions for managing the application and Kaspersky Security Service in Kaspersky Security Center for a group of servers or for a separate server.

To access permissions for managing the application and Kaspersky Security Service:

1. Expand the Managed devices node in the Kaspersky Security Center Administration Console tree.

2. Select the administration group for which you want to configure application settings.

3. Perform one of the following actions in the details pane of the selected administration group:
   - To configure application settings for a group of servers, select the Policies tab and open the Properties: <Policy name> window (see Section "Configuring policy" on page 119).
   - To configure the application for a single server, select the Devices tab and open the Application settings window (see Section "Configuring local tasks in the Application settings window of the Kaspersky Security Center" on page 124).

If an active Kaspersky Security Center policy is applied to a device, and this policy blocks changes to application settings, then these settings cannot be edited in the Application settings window.
4. Open the **Supplementary** section and do the following:

   - To configure access permissions for managing Kaspersky Security for Windows Server for a user or group of users, in the **User access permissions for application management** section click the **Settings** button.

   - To configure access permissions for managing Kaspersky Security Service for a user or group of users, in the **User access permissions for Security Service management** section click the **Settings** button.

5. In the window that opens, configure the access privileges (see Section "Managing access permissions for Kaspersky Security for Windows Server functions" on page 228) according to your needs. The specified settings are saved.
Real-Time File Protection

This section contains information about the Real-Time File Protection task and how to configure it.

**About Real-Time File Protection task**

When the Real-Time File Protection task is running, Kaspersky Security for Windows Server scans the following protected server objects when they are accessed:

- Files.
- Alternate file system streams (NTFS streams).
- Master boot records and boot sectors on the local hard drives and external devices.

When any application writes a file to a server or reads a file from it, Kaspersky Security for Windows Server intercepts this file, scans it for threats, and, if a threat is detected, performs a default action or an action you have specified: tries to disinfect it, places it in Quarantine, or deletes it. Before disinfection or deletion, Kaspersky Security for Windows Server saves an encrypted copy of the source file to the Backup folder. Kaspersky Security for Windows Server restores the file in the original folder if it is not infected or if it has been successfully disinfected.

A container is an isolated environment, which allows applications to run without direct interaction with the operating system. If container is located in task the task protection scope, Kaspersky Security for Windows Server scans container files, which are being accessed by users, for computer threats. When a threat is detected, the application attempts to disinfect the container. If the attempt is successful, the container continues to work; if disinfection fails, the container is shut down.

Kaspersky Security for Windows Server also detects malware for processes running under Windows Subsystem for Linux®. For such processes, the Real-Time File Protection task applies action defined by the current configuration.
About the task protection scope and security settings

By default, the Real-Time File Protection task protects all objects of the server file system. If there is no security requirement to protect all objects of the file system or you want to exclude any objects from the task scope, you can limit the protection scope.

In the Application Console, the protection scope is displayed as a tree or in the list of the server file resources that Kaspersky Security for Windows Server can control. By default, the network file resources of the protected server are displayed in a list-view mode.

In the Administration Plug-in only the list view is available.

To display network file resources in the tree-view mode in the Application Console,

open the drop down list in the Protection scope settings window upper left sector and select Tree-view.

The items or nodes are displayed in a list-view or in a tree-view mode of the server file resources as follows:

- The node is included in the protection scope.
- The node is excluded from the protection scope.
- At least one of the child nodes of this node is excluded from the protection scope, or the security settings of the child node(s) differ(s) from the setting of a parental node (for a tree-view mode only).

The icon is displayed if all child nodes are selected, but the parent node is not selected. In this case, changes in the composition of files and folders of the parent node are disregarded automatically when the protection scope for the selected child node is being created.

Using the Application Console, you can also add virtual drives (see Section "Creating virtual protection scope" on page 266) to the protection scope. The names of the virtual nodes are displayed in blue font.

Security settings

The task security settings can be configured as common settings for all nodes or items included in the protection scope, or as different settings for each node or item in the server file resource tree or list.

Security settings configured for the selected parent node are automatically applied to all its child nodes. The security settings of the parent node are not applied to child nodes that are configured separately.

The settings for a selected protection scope can be configured using one of the following methods:

- Selecting one of three predefined security levels (on page 240).
- Configuring the security settings manually (see Section "Configuring security settings manually" on page 252) for the selected nodes or items in the file resources tree or list (the security level changes to Custom).

A set of settings for a node or item can be saved in a template in order to be applied later to other nodes or items.
About virtual protection scope

Kaspersky Security for Windows Server can scan not only existing folders and files on hard and removable drives, but also drives that are connected to the server temporarily, for example, common cluster drives that are dynamically created on the server by various applications and services.

If all server objects are included in the protection scope, these dynamic nodes will automatically be included in the protection scope. However, if you want to specify special values for the security settings of these dynamic nodes or if you have selected not the entire server for protection, but discrete areas of it, then in order to include dynamic drives, files or folders in the protection scope, you will first have to create them in the Application Console: that is, specify the virtual protection scope. The drives, files and folders created will exist only in the Application Console, but not in the file structure of the protected server.

If, while creating a protection scope, all subfolders or files are selected without the parent folder being selected, then all dynamic folders or files which will appear in it will not automatically be included in the protected scope. "Virtual copies" of these should be created in the Application Console and added to the protection scope.

Predefined protection scopes

The file resources tree or list displays the nodes to which you have read-access based on the configured security settings of Microsoft Windows.

Kaspersky Security for Windows Server covers the following predefined protection scopes:

- **Local hard drives.** Kaspersky Security for Windows Server protects files on the server hard drives.
- **Removable drives.** Kaspersky Security for Windows Server protects files on external devices, such as CDs or USB drives. All removable disks, individual disks, folders or files can be included in or excluded from the protection scope.
- **Network.** Kaspersky Security for Windows Server protects files that are written to network folders or read from them by applications running on the server. Kaspersky Security for Windows Server does not protect files when such files are accessed by applications from other computers.
- **Virtual drives.** Dynamic folders and files and drives that are temporarily connected to the server can be included in the protection scope, for example, common cluster drives.

By default, you can view and configure predefined protection scopes in the scope list; you can also add predefined scopes to the list during its formation in the protection scope settings.

By default, the protection scope includes all predefined areas except virtual drives.

Virtual drives created using a SUBST command are not displayed in the server file resource tree in the Application Console. To include objects on the virtual drive in the protection scope, include the server folder with which this virtual drive is associated in the protection scope.

Connected network drives will also not be displayed in the server file resources list. To include objects on network drives in the protection scope, specify the path to the folder which corresponds to this network drive in UNC format.
Predefined security levels

One of the following predefined security levels for the nodes selected either in the computer file resources tree or file resources list can be applied: Maximum performance, Recommended, and Maximum protection. Each of these levels contains its own predefined set of security settings (see the table below).

Maximunm performance

The Maximum performance security level is recommended if, beyond using Kaspersky Security for Windows Server on servers and work stations, there are additional server security measures inside your network, for example, firewalls and existing security policies.

Recommended

The Recommended security level ensures an optimum combination of protection and performance impact on protected servers. This level is recommended by Kaspersky Lab experts as sufficient to protect servers on most corporate networks. The Recommended security level is set by default.

Maximum protection

The Maximum protection security level is recommended if your organization’s network has elevated computer security requirements.

Table 41. Preset security levels and corresponding setting values

<table>
<thead>

Default Real-Time File Protection task settings

By default, the Real-Time File Protection task uses the settings described in the table below. You can change the values of these settings.

<table>
<thead>
<tr>
<th>Setting</th>
<th>Default Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Protection scope</td>
<td>The entire computer, excluding virtual drives.</td>
<td>You can limit the protection scope.</td>
</tr>
<tr>
<td>Objects protection mode</td>
<td>On access and modification</td>
<td>You can select protection mode, i.e. define type of access at which Kaspersky Security for Windows Server will scan objects.</td>
</tr>
<tr>
<td>Heuristic analyzer</td>
<td>The Medium security level is applied.</td>
<td>The Heuristic Analyzer can be enabled or disabled and the analysis level configured.</td>
</tr>
<tr>
<td>Apply Trusted Zone</td>
<td>Applied.</td>
<td>General list of exclusions which can be used in selected tasks.</td>
</tr>
<tr>
<td>Use KSN for protection</td>
<td>Applied.</td>
<td>You can improve your server protection using the Kaspersky Security Network infrastructure of cloud services (available if the KSN Statement is accepted).</td>
</tr>
<tr>
<td>Task start schedule</td>
<td>At application start.</td>
<td>You can configure scheduled task start.</td>
</tr>
<tr>
<td>Block access to network shared resources for the hosts that show malicious activity</td>
<td>Not applied.</td>
<td>You can add hosts showing malicious activity to the list of blocked hosts.</td>
</tr>
</tbody>
</table>
Managing Real-Time File Protection task via the Administration Plug-in

In this section, learn how to navigate the Administration Plug-In interface and configure task settings for one or all servers on the network.

In this section

| Navigation | 245 |
| Configuring the Real-Time File Protection task | 246 |
| Creating and configuring the task protection scope | 250 |
| Configuring security settings manually | 252 |

Navigation

Learn how to navigate to the required task settings via the interface.

In this section

| Opening policy settings for the Real-Time File Protection task | 245 |
| Opening the Real-Time File Protection task properties | 246 |

Opening policy settings for the Real-Time File Protection task

▸ To open the Real-Time File Protection task settings via the Kaspersky Security Center policy:

1. Expand the Managed devices node in the Kaspersky Security Center Administration Console tree.
2. Select the administration group for which you want to configure the task.
3. Select the Policies tab.
4. Double-click the policy name you want to configure.
5. In the Properties: <Policy name> window that opens, select the Real-time server protection section.
6. Click the Settings button in the Real-Time File Protection subsection.
   The Real-time file protection window opens.

If a server is being managed by an active Kaspersky Security Center policy and this policy blocks changes to the application settings, these settings cannot be edited via the Application Console.
Opening the Real-Time File Protection task properties

► To open the Real-Time File Protection task settings window for a single network server:

1. Expand the Managed devices node in the Kaspersky Security Center Administration Console tree.
2. Select the administration group for which you want to configure the task.
3. Select the Devices tab.
4. Open the Properties: <Server name> window in one of the following ways:
   - Double-click the name of the protected server.
   - Select the Properties item in the context menu of the protected server.
   The Properties: <Server name> window opens.
5. In the Tasks section, select the Real-Time File Protection task.
6. Click the Properties button.
   The Properties: Real-Time File Protection window opens.

Configuring the Real-Time File Protection task

► To configure the Real-Time File Protection task settings:

1. Open the Real-time file protection window (see Section "Opening policy settings for the Real-Time File Protection task" on page 245).
2. Configure the following task settings:
   - On the General tab:
     - Objects protection mode (see Section "Selecting protection mode" on page 247)
     - Heuristic analyzer
     - Integration with other components (see Section "Configuring Heuristic Analyzer and integration with other application components" on page 248)
   - On the Task management tab:
     - Scheduled task start settings (see Section "Configuring the task start schedule settings" on page 134).
3. Select the Protection scope tab and do the following:
   - Click the Add or Edit button to edit the protection scope (see Section "Creating protection scope" on page 264).
   - In the window that opens, choose what you want to include in the task protection scope:
     - Predefined scope
     - Disk, folder or network location
     - File
   - Select one of the predefined security levels (on page 240) or manually configure the protection (see Section "Configuring security settings manually" on page 252) settings.
4. Click OK in the **Real-time file protection** window.

Kaspersky Security for Windows Server immediately applies the new settings to the running task. Information about the date and time when the settings were modified, and the values of task settings before and after modification, are saved in the system audit log.

**In this section**

- Selecting protection mode ................................................................. 247
- Configuring Heuristic Analyzer and integration with other application components ........................................... 248
- Configuring the task start schedule settings ..................................................................................................... 249

**Selecting protection mode**

In the Real-Time File Protection task, the protection mode can be selected. The **Objects protection mode** section lets you specify the type of access to objects upon which Kaspersky Security for Windows Server should scan the objects.

The **Objects protection mode** setting has the common value for the entire protection scope specified in the task. You cannot specify different values for the setting for individual nodes within the protection scope.

大幅提升

**To select the protection mode:**

1. Open the **Real-time file protection** window (see Section “Opening policy settings for the Real-Time File Protection task” on page 245).

2. In the window that opens, open the **General** tab and select the protection mode that you want to set:

   - **Smart mode**

     Kaspersky Security for Windows Server selects objects to be scanned on its own. The object is scanned on being opened and then again after being saved if the object has been modified. If multiple calls to the object were made by the process while it was running and if the process modified it, Kaspersky Security for Windows Server rescans the object only after the object was saved by the process for the last time.

   - **On access and modification**

     Kaspersky Security for Windows Server scans the object when it is opened and rescans after it is saved if the object was modified.

     This option is selected by default.

   - **On access**

     Kaspersky Security for Windows Server scans all objects when they are opened for reading or for execution or modification.

   - **When run**

     Kaspersky Security for Windows Server scans the file only when it is accessed to be executed.

3. Click OK.

The selected protection mode will take effect.
Configuring Heuristic Analyzer and integration with other application components

To start the KSN Usage task, you must accept the Kaspersky Security Network Statement.

To configure the Heuristic Analyzer and Integration with other components:

1. Open the **Real-time file protection** window (see Section "Opening policy settings for the Real-Time File Protection task" on page 245).

2. On the **General** tab, clear or select the **Use heuristic analyzer** check box.

   This check box enables / disables Heuristic Analyzer during object scanning.

   If the check box is selected, Heuristic Analyzer is enabled.

   If the check box is cleared, Heuristic Analyzer is disabled.

   The check box is selected by default.

3. If necessary, adjust the level of analysis using the slider.

   The slider allows you to adjust the heuristic analysis level. The scanning intensity level sets the balance between the thoroughness of searches for threats, the load on the operating system's resources and the time required for scanning.

   The following scanning intensity levels are available:

   - **Light**. Heuristic analyzer performs fewer operations found inside executable files. The probability of threat detection in this mode is somewhat lower. Scanning is faster and less resource-intensive.

   - **Medium**. Heuristic Analyzer performs the number of instructions found within executable files recommended by the experts of Kaspersky Lab.

   The slider allows you to adjust the heuristic analysis level. The scanning intensity level sets the balance between the thoroughness of searches for threats, the load on the operating system's resources and the time required for scanning.

   The following scanning intensity levels are available:

   - **Deep**. Heuristic analyzer performs more operations found in executable files. The probability of threat detection in this mode is higher. The scan uses up more system resources, takes more time, and can cause a higher number of false alarms.

   The slider is available if the **Use heuristic analyzer** check box is selected.

4. In the **Integration with other components** section, configure the following settings:

   - Select or clear the **Apply Trusted Zone** check box.

     This check box enables / disables use of the Trusted Zone for a task.

     If the check box is selected, Kaspersky Security for Windows Server adds file operations of trusted processes to the scan exclusions configured in the task settings.

     If the check box is cleared, Kaspersky Security for Windows Server disregards the file operations of trusted processes when forming the protection scope for the task.

     The check box is selected by default.

   - Select or clear the **Use KSN for protection** check box.

     This check box enables or disables the use of KSN services.

     If the check box is selected, the application uses Kaspersky Security Network data to ensure that the application responds more quickly to new threats and to reduce the likelihood of false positives.
If the check box is cleared, the task does not use KSN services. The check box is selected by default.

The **Send data about scanned files** check box must be selected in the KSN Usage task settings.

- Select or clear the **Block access to network shared resources for the hosts that show malicious activity** check box.

5. Click **OK**.

Configured task settings are applied immediately to the running task. If the task is not running, the modified settings are applied at next start.

**Configuring the task start schedule settings**

You can configure the start schedule for local system and custom tasks in the Application Console. You cannot configure the start schedule for group tasks.

► **To configure group task start schedule settings, do the following:**

1. In the Kaspersky Security Center Administration Console tree, expand the **Managed devices** node.
2. Select the group that the protected server belongs to.
3. In the details pane, select the **Tasks** tab.
4. Open the **Properties: <Task name>** window in one of the following ways:
   - Double-click the name of the task.
   - Open the context menu of the task name and select the Properties item.
5. Select **Schedule** section.
6. In the **Schedule settings** block, select the **Run by schedule** check box.

Fields with the schedule settings for the On-Demand Scan and Update tasks are unavailable if their scheduled start is blocked by a policy of Kaspersky Security Center.

7. Configure schedule settings in accordance with your requirements. To do this, perform the following actions:
   a. In the **Frequency** list, select one of the following values:
      - **Hourly**, if you want the task to run at intervals of a specified number of hours; specify the number of hours in the **Every <number> hour(s)** field.
      - **Daily**, if you want the task to run at intervals of a specified number of days; specify the number of days in the **Every <number> day(s)** field.
      - **Weekly**, if you want the task to run at intervals of a specified number of weeks; specify the number of weeks in the **Every <number> week(s)** field. Specify the days of the week on which the task will be started (by default the task runs on Mondays).
- **At application launch**, if you want the task to run every time Kaspersky Security for Windows Server starts.

- **After application database update**, if you want the task to run after every update of the application databases.

b. Specify the time for the first task start in the **Start time** field.

c. In the **Start date** field, specify the date from which the schedule applies.

After you have specified the task start frequency, the time of the first task start, and the date from which the schedule applies, information about the estimated time for the next task start will appear in the top part of the window in the **Next start** field. Updated information about the estimated time of the next task start will be displayed each time you open the **Task settings** window of the **Schedule** tab.

The **Blocked by policy** value is displayed in the **Next start** field if the active policy settings of Kaspersky Security Center prohibit start of scheduled system tasks (see Section "Configuring scheduled start of local system tasks" on page 102).

8. Use the **Advanced** tab to configure the following schedule settings in accordance with your requirements.

- In the **Task stop settings** section:
  a. Select the **Duration** check box and enter the required number of hours and minutes in the fields to the right to specify the maximum duration of the task execution.
  b. Select the **Pause from** check box and enter the start and end values of the time interval in the fields to the right to specify a time interval under 24 hours during which task execution will be paused.

- In the **Advanced settings** section:
  a. Select the **Cancel schedule from** check box and specify the date from which the schedule will cease to operate.
  b. Select the **Run skipped tasks** check box to enable the start of skipped tasks.
  c. Select the **Randomize the task start time within the interval of** of check box and specify a value in minutes.

9. Click **OK**.

10. Click the **Apply** button to save the task start settings.

If you want to configure application settings for a single task using Kaspersky Security Center, perform the steps described in Configuring local tasks in the Application settings window of the Kaspersky Security Center (on page 124) section.

### Creating and configuring the task protection scope

**To create and configure the task protection scope via the Kaspersky Security Center:**

1. Open the **Real-time file protection** window (see Section "Opening policy settings for the Real-Time File Protection task" on page 245).

2. Select the **Protection scope** tab.
3. All items already protected by the task are listed in the Protection scope table.

4. Click the Add button to add new item to the list.
   The Add objects to protection scope window opens.

5. Select an object type to add it to a protection scope:
   - **Predefined scope** to include one of the predefined scopes into protection scope on the server. Then in the drop down list select a necessary protection scope.
   - **Disk, folder or network location** to include individual drive, folder or a network object into a protection scope. Then select a necessary protection scope by clicking the Browse button.
   - **File** to include an individual file into protection scope. Then select a necessary protection scope by clicking the Browse button.

   You cannot add an object into protection scope if it has already been added as an exclusion out of a protection scope.

6. To exclude individual items from the protection scope, clear check boxes next to the names of these items or take the following steps:
   a. Open the context menu on the protection scope by right-clicking it.
   b. In the context menu select Add exclusion option.
   c. In the Add exclusion window select an object type that you want to add as an exclusion out of the protection scope following the logic of the adding object to a protection scope procedure.

7. To modify the protection scope or an exclusion added, select the Edit scope option in the context menu for the necessary protection scope.

8. To hide the previously added protection scope or an exclusion in the list of network file resources, select the Remove scope option in the context menu for the necessary protection scope.

   The protection scope is excluded out of the Real-Time File Protection task scope on its removal from the network file resources list.

9. Click the Save button.
   Protection scope settings window is closed. Your newly configured settings are saved.

The Real-Time File Protection task can be started if at least one of the computer file resource nodes is included into a protection scope.
Configuring security settings manually

By default, the Real-Time File Protection task uses common security settings for the entire protection scope. These settings correspond to the Recommended predefined security level (see Section "Predefined security levels" on page 240).

The default values of security settings can be modified by configuring them as common settings for the entire protection scope or as different settings for different items in the server file resource list or nodes in the tree.

To configure the security settings of the selected node manually:

1. Open the Real-time file protection window (see Section "Opening policy settings for the Real-Time File Protection task" on page 245).
2. On the Protection scope tab, select the node whose security settings you want to configure, and click Configure.
   The Real-time file protection settings window opens.
3. On the Security level tab click the Settings button to set custom configuration.
4. You can configure the custom security settings of the selected node in accordance with your requirements:
   - General settings (see Section "Configuring general task settings" on page 253)
   - Actions (see Section "Configuring actions" on page 255)
   - Performance (see Section "Configuring performance" on page 257)
5. Click OK in the Real-time file protection window.
   New protection scope settings are saved.

In this section

Configuring general task settings

To configure the general security settings of the Real-Time File Protection task:

1. Open the Real-time file protection settings window (see Section "Opening policy settings for the Real-Time File Protection task" on page 245).
2. Select the General tab.
3. In the Objects protection section, specify the objects types that you want to include in the protection scope:
   - All objects
     Kaspersky Security for Windows Server scans all objects.
   - Objects scanned by format
     Kaspersky Security for Windows Server scans only infectable objects based on file format.
     Kaspersky Lab compiles the list of formats. It is included in the Kaspersky Security for Windows Server databases.
   - Objects scanned according to list of extensions specified in anti-virus database
     Kaspersky Security for Windows Server scans only infectable objects based on file extension.
     Kaspersky Lab compiles the list of extensions. It is included in the Kaspersky Security for Windows Server databases.
   - Objects scanned by specified list of extensions
     Kaspersky Security for Windows Server scans files based on file extension. List of file extensions can be manually customized in the List of extensions window, which can be opened by clicking the Edit button.
   - Scan disk boot sectors and MBR
     Enables protection of boot sectors and master boot records.
     If the check box is selected, Kaspersky Security for Windows Server scans boot sectors and master boot records on hard drives and removable drives of the server.
     The check box is selected by default.
   - Scan alternate NTFS streams
     Scanning of alternative file and folder streams on the NTFS file system drives.
     If the check box is selected, the application scans a probably infected object and all NTFS streams associated with that object.
     If the check box is cleared, the application scans only the object that was detected and considered as probably infected.
     The check box is selected by default.
4. In the Performance section, select or clear the Protect only new and modified files check box.
   This check box enables / disables scanning and protection of files that have been recognized by Kaspersky Security for Windows Server as new or modified since the last scan.
If the check box is selected, Kaspersky Security for Windows Server scans and protects only the files that it has recognized as new or modified since the last scan.

If the check box is cleared, you can select if you want to scan and protect only new files or all files disregarding their modification status.

By default, the check box is selected for the Maximum performance security level. If the Maximum protection or Recommended security levels are set, the check box is cleared.

To switch between available options when the check box is cleared, click on the All / Only new link for each of the compound object types.

5. In the Compound objects protection section, specify the compound objects that you want to include in the protection scope:

- **All / Only new archives**
  Scanning of ZIP, CAB, RAR, ARJ archives and other archive formats.
  If this check box is selected, Kaspersky Security for Windows Server scans archives.
  If this check box is cleared, Kaspersky Security for Windows Server skips archives during scanning.
  The default value depends on the selected protection level.

- **All / Only new SFX archives**
  Scanning of self-extracting archives.
  If this check box is selected, Kaspersky Security for Windows Server scans SFX archives.
  If this check box is cleared, Kaspersky Security for Windows Server skips SFX archives during scanning.
  The default value depends on the selected protection level.
  This option is active when the Archives check box is cleared.

- **All / Only new email databases**
  Scanning of Microsoft Outlook and Microsoft Outlook Express mail database files.
  If this check box is selected, Kaspersky Security for Windows Server scans mail database files.
  If this check box is cleared, Kaspersky Security for Windows Server skips mail database files during scanning.
  The default value depends on the selected security level.

- **All / Only new packed objects**
  Scanning of executable files packed by binary code packers, such as UPX or ASPack.
  If this check box is selected, Kaspersky Security for Windows Server scans executable files packed by packers.
  If this check box is cleared, Kaspersky Security for Windows Server skips executable files packed by packers during scanning.
  The default value depends on the selected protection level.
• **All / Only new plain email**

  Scanning of files of mail formats, such as Microsoft Outlook and Microsoft Outlook Express messages.

  If this check box is selected, Kaspersky Security for Windows Server scans files of mail formats.

  If this check box is cleared, Kaspersky Security for Windows Server skips files of mail formats during scanning.

  The default value depends on the selected security level.

• **All / Only new embedded OLE objects**

  Scanning of objects embedded into files (such as Microsoft Word macros, or email message attachments).

  If this check box is selected, Kaspersky Security for Windows Server scans objects embedded into files.

  If this check box is cleared, Kaspersky Security for Windows Server skips objects embedded into files during scanning.

  The default value depends on the selected protection level.

6. Click **Save**.

   New task configuration will be saved.

### Configuring actions

> To configure the actions on infected and other detected objects for the Real-Time File Protection task:

1. Open the **Real-time file protection settings** (see Section "Opening policy settings for the Real-Time File Protection task" on page 245) window.

2. Select the **Actions** tab.

3. Select the action to be performed on infected and other detected objects:

   • **Notify only**.
     
     When this mode is selected, Kaspersky Security for Windows Server does not block access to detected or other detected objects, or perform any actions on them. The following event is registered in the task log: **Object not disinfected. Reason: no action was taken to neutralize detected object due to user-defined settings.** The event specifies all available information about the detected object.

     The **Notify only** mode should be separately configured for each protection or scan area. This mode is not used by default on any of the security levels. If you select this mode, Kaspersky Security for Windows Server automatically changes the security level to **Custom**.

   • **Block access**.

     When this option is selected Kaspersky Security for Windows Server blocks access to the detected or probably infected object. You can select additional action over blocked objects in the drop-down list.
- **Perform additional action.**
  Select the action from the drop-down list:
  - Disinfect.
  - Disinfect. Remove if disinfection fails.
  - Remove.
  - Recommended.

4. Select the action to be performed on probably infected objects:
   - **Notify only.**
     When this mode is selected, Kaspersky Security for Windows Server does not block access to detected or other detected objects, or perform any actions on them. The following event is registered in the task log: *Object not disinfected. Reason: no action was taken to neutralize detected object due to user-defined settings.* The event specifies all available information about the detected object.
     The *Notify only* mode should be separately configured for each protection or scan area. This mode is not used by default on any of the security levels. If you select this mode, Kaspersky Security for Windows Server automatically changes the security level to Custom.

   - **Block access.**
     When this option is selected Kaspersky Security for Windows Server blocks access to the detected or probably infected object. You can select additional action over blocked objects in the drop-down list.

   - **Perform additional action.**
     Select the action from the drop-down list:
     - Quarantine.
     - Remove.
     - Recommended.

5. Configure actions to be performed on objects depending on the type of object detected:
   a. Clear or select the *Perform actions depending on the type of object detected* check box.
     If the check box is selected, you can independently set primary and secondary action for each detected object type by clicking the **Settings** button next to the check box. At that, Kaspersky Security for Windows Server will not allow to open or execute an infected object regardless of your choice.
     If the check box is cleared, Kaspersky Security for Windows Server performs actions that are selected in the *Action to perform on infected and other objects* and *Action to perform on probably infected objects* sections for named object types respectively.
     The check box is cleared by default.
   b. Click the **Settings** button.
   c. In the window that opens select first and secondary action (if the first action fails) for each type of the detected object.
   d. Click **OK**.
6. Select the action to perform on unmodifiable compound files: select or clear the **Entirely remove compound file that cannot be modified by the application in case of embedded object detect** check box.

   This check box enables or disables forced removal of the parent compound file when a malicious, probably infected or other detected child embedded object is detected.

   If the check box is selected and the task is configured to remove infected and probably infected objects, Kaspersky Security for Windows Server forcibly removes the entire parent compound object when a malicious or other embedded object is detected. Enforced removal of a parent file along with all of its contents happens if the application cannot remove only the detected child object (for example, if the parent object is unmodifiable).

   If this check box is cleared and the task is configured to remove infected and probably infected objects, Kaspersky Security for Windows Server does not perform the selected action, if the parent object is unmodifiable.

7. Click **Save**. New task configuration will be saved.

**Configuring performance**

*To configure the performance for the Real-Time File Protection task:*

1. Open the **Real-time file protection settings** (see Section "Opening policy settings for the Real-Time File Protection task" on page 245) window.

2. Select the **Performance** tab.

3. In the **Exclusions** section:
   - Clear or select the **Exclude files** check box.
     
     Excluding files from scanning by file name or file name mask.

     If this check box is selected, Kaspersky Security for Windows Server skips specified objects during scanning.

     If this check box is cleared, Kaspersky Security for Windows Server scans all objects.

     The check box is cleared by default.

   - Clear or select the **Do not detect** check box.
     
     Objects are excluded from scanning by the name or name mask of the detectable object.

     The list of names of detectable objects is available on the Virus Encyclopedia
     

     If this check box is selected, Kaspersky Security for Windows Server skips specified detectable objects during scanning.

     If the check box is cleared, Kaspersky Security for Windows Server detects all objects specified in the application by default.

     The check box is cleared by default.

   - Click the **Edit** button for each setting to add exclusions.
4. In the **Advanced settings** section:

- **Stop scanning if it takes longer than (sec.)**
  
  Limits the duration of object scanning. The default value is 60 seconds.
  
  If the check box is cleared, scan duration is limited to the specified value.
  
  If the check box is cleared, scan duration is unlimited.
  
  By default, the check box is selected for the **Maximum performance** security level.

- **Do not scan compound objects larger than (MB)**
  
  Excludes objects larger than the specified size from the scanning.
  
  If the check box is selected, Kaspersky Security for Windows Server skips compound objects whose size exceeds the specified limit during virus scan.
  
  If this check box is cleared, Kaspersky Security for Windows Server scans compound objects of any size.
  
  By default, the check box is selected for the **Maximum performance** security level.

- **Use iSwift technology**
  
  iSwift compares file NTFS identifier, that is stored in a database, with a current identifier. The scanning is performed only for files, whose identifiers has changed (new files and files modified since the last scan of NTFS system objects).
  
  If the check box is selected, Kaspersky Security for Windows Server scans only new files or those modified since the last scan of NTFS system objects.
  
  If the check box is cleared, Kaspersky Security for Windows Server scans objects of NTFS file system disregarding the date of file creation or modification except for files from network folders.
  
  The check box is selected by default.

- **Use iChecker technology**
  
  iChecker calculates and remembers checksums of scanned files. If an object is modified the checksum changes. The application compares all checksums during the scan task and scans only new and modified since the last scan files.
  
  If the check box is selected, Kaspersky Security for Windows Server scans only new and modified files.
  
  If the check box is cleared, Kaspersky Security for Windows Server scans files disregarding the date of file creation or modification.
  
  The check box is selected by default.
Managing Real-Time File Protection task via the Application Console

In this section, learn how to navigate the Application Console interface and configure task settings on a local server.

Navigation

Learn how to navigate to the required task settings via the interface.

Opening the Real-Time File Protection scope settings

To open the Protection scope settings window for the Real-Time File Protection task:

1. In the Application Console tree, expand the Real-Time Server Protection node.
2. Select the Real-Time File Protection child node.
3. Click the Configure protection scope link in the details pane.
   The Protection scope settings window opens.

Opening the Real-Time File Protection task settings

To open the general task settings window:

1. In the Application Console tree, expand the Real-Time Server Protection node.
2. Select the Real-Time File Protection child node.
3. Click the Properties link in the details pane.
   The Task settings window opens.
Configuring the Real-Time File Protection task

To configure the Real-Time File Protection task settings:

1. Open the Task settings window (see Section "Opening the Real-Time File Protection task settings" on page 259).
2. On the General tab, configure the following task settings:
   - Objects protection mode (see Section "Selecting protection mode" on page 260)
   - Heuristic analyzer
   - Integration with other components (see Section "Configuring Heuristic Analyzer and integration with other application components" on page 261)
3. On the Schedule and Advanced tabs, specify the scheduled start settings (see Section "Configuring the task start schedule settings" on page 153).
4. Click OK in the Task settings window.
   The modified settings are saved.
5. In the details pane of the Real-Time File Protection node click the Configure protection scope link.
6. Do the following:
   - In the tree or in the list of file resources of the server, select the nodes or items that you want to be included in the task protection scope.
   - Select one of the predefined security levels or configure the object protection settings manually (see Section "Configuring security settings manually" on page 482).
7. In the Protection scope settings window, click the Save button.

Kaspersky Security for Windows Server immediately applies the new settings to the running task. Information about the date and time of the settings modification, and the values of task settings set before and after modification, are saved in the system audit log.

In this section

<table>

Selecting protection mode

In the Real-Time File Protection task, the protection mode can be selected. The Objects protection mode section lets you specify the type of access to objects upon which Kaspersky Security for Windows Server should scan the objects.

The Objects protection mode setting has the common value for the entire protection scope specified in the task. You cannot specify different values for the setting for individual nodes within the protection scope.
To select protection mode, take the following steps:

1. Open the Task settings window (see Section "Opening the Real-Time File Protection task settings" on page 259).

2. In the window that opens, open the General tab and select the protection mode that you want to set:

   - **Smart mode**
     Kaspersky Security for Windows Server selects objects to be scanned on its own. The object is scanned on being opened and then again after being saved if the object has been modified. If multiple calls to the object were made by the process while it was running and if the process modified it, Kaspersky Security for Windows Server rescans the object only after the object was saved by the process for the last time.

   - **On access and modification**
     Kaspersky Security for Windows Server scans the object when it is opened and rescans after it is saved if the object was modified.
     This option is selected by default.

   - **On access**
     Kaspersky Security for Windows Server scans all objects when they are opened for reading or for execution or modification.

   - **When run**
     Kaspersky Security for Windows Server scans the file only when it is accessed to be executed.

3. Click OK.
   The selected protection mode will take effect.

Configuring Heuristic Analyzer and integration with other application components

To start the KSN Usage task, you must accept the Kaspersky Security Network Statement.

To configure the Heuristic Analyzer and Integration with other components:

1. Open the Task settings (see Section "Opening the Real-Time File Protection task settings" on page 259) window.

2. On the General tab, clear or select the Use heuristic analyzer check box.
   This check box enables / disables Heuristic Analyzer during object scanning.
   If the check box is selected, Heuristic Analyzer is enabled.
   If the check box is cleared, Heuristic Analyzer is disabled.
   The check box is selected by default.
3. If necessary, adjust the level of analysis using the slider.

   The slider allows you to adjust the heuristic analysis level. The scanning intensity level sets the balance between the thoroughness of searches for threats, the load on the operating system’s resources and the time required for scanning.

   The following scanning intensity levels are available:

   - **Light**. Heuristic analyzer performs fewer operations found inside executable files. The probability of threat detection in this mode is somewhat lower. Scanning is faster and less resource-intensive.
   - **Medium**. Heuristic Analyzer performs the number of instructions found within executable files recommended by the experts of Kaspersky Lab. This level is selected by default.
   - **Deep**. Heuristic analyzer performs more operations found in executable files. The probability of threat detection in this mode is higher. The scan uses up more system resources, takes more time, and can cause a higher number of false alarms.

   The slider is available if the Use heuristic analyzer check box is selected.

4. In the **Integration with other components** section, configure the following settings:

   - Select or clear the **Apply Trusted Zone** check box.
     This check box enables / disables use of the Trusted Zone for a task.
     If the check box is selected, Kaspersky Security for Windows Server adds file operations of trusted processes to the scan exclusions configured in the task settings.
     If the check box is cleared, Kaspersky Security for Windows Server disregards the file operations of trusted processes when forming the protection scope for the task.
     The check box is selected by default.

   Click the **Trusted Zone** link to open the Trusted Zone settings.

   - Select or clear the **Use KSN for protection** check box.
     This check box enables or disables the use of KSN services.
     If the check box is selected, the application uses Kaspersky Security Network data to ensure that the application responds more quickly to new threats and to reduce the likelihood of false positives.
     If the check box is cleared, the task does not use KSN services.
     The check box is selected by default.

     The **Send data about scanned files** check box must be selected in the KSN Usage task settings.

   - Select or clear the **Block access to network shared resources for the hosts that show malicious activity** check box.

5. Click **OK**.

   The newly configured settings will be applied.
Configuring the task start schedule settings

You can configure the start schedule for local system and custom tasks in the Application Console. You cannot configure the start schedule for group tasks.

To configure task start schedule settings:

1. Open the context menu for the task for which you wish to configure the start schedule.
2. Select Properties.
   The Task settings window opens.
3. In the window that opens, on the Schedule tab, select the Run by schedule check box.
4. Configure schedule settings in accordance with your requirements. To do this, perform the following actions:
   a. In the Frequency, select one of the following values:
      - Hourly, if you want the task to run at intervals of a specified number of hours; specify the number of hours in the Every <number> hour(s) field.
      - Daily, if you want the task to run at intervals of a specified number of days; specify the number of days in the Every <number> day(s) field.
      - Weekly, if you want the task to run at intervals of a specified number of weeks; specify the number of weeks in the Every <number> week(s) on field. Specify the days of the week on which the task will be started (by default the task runs on Mondays).
      - At application launch, if you want the task to run every time Kaspersky Security for Windows Server starts.
      - After application database update, if you want the task to run after every update of the application databases.
   b. Specify the time for the first task start in the Start time field.
   c. In the Start date field, specify the date from which the schedule applies.

5. Use the Advanced tab to configure the following schedule settings in accordance with your requirements.
   a. In the Task stop settings section:
      - Select the Duration check box and enter the required number of hours and minutes in the fields to the right to specify the maximum duration of the task execution.
      - Select the Pause from check box and enter the start and end values of the time interval in the fields to the right to specify a time interval under 24 hours during which task execution will be paused.
In the **Advanced settings** section:

a. Select the **Cancel schedule from** check box and specify the date from which the schedule will cease to operate.

b. Select the **Run skipped tasks** check box to enable the start of skipped tasks.

c. Select the **Randomize the task start within interval of** check box and specify a value in minutes.

6. Click **OK**.

The configured task start settings will be saved.

---

**Creating protection scope**

This section provides instructions on creating and managing a protection scope in the Real-Time File Protection task.

---

**In this section**

- Creating protection scope .......................................................... 264
- Creating virtual protection scope ...................................................... 266

---

**Creating protection scope**

The procedure of creating the Real-Time File Protection task scope depends on the network file resources view mode (see Section "About the task protection scope and security settings" on page 238). You can configure network file resources view mode as a tree or as a list (set as default).

---

To apply the new protection scope settings to the task, the Real-Time File Protection task must be restarted.

---

► **To create a protection scope using the network file resources tree:**

1. Open the **Protection scope settings** window (see Section "Opening the Real-Time File Protection scope settings" on page 259).

2. In the left section of the window open the network file resources tree to display all the nodes and child nodes.

3. Do the following:
   
   - To exclude individual nodes from the protection scope, clear check boxes next to the names of these nodes.
   
   - To include individual nodes in the protection scope, clear the **My Computer** check box and do the following:
     
     - If all drives of one type are to be included in the protection scope, select the check box opposite the name of the required disk type (for example, to add all removable drives on the server, select the **Removable drives** check box).
• If an individual disk of a certain type is to be included in the protection scope, expand the node that contains the list of drives of this type and check the box next to the name of the required drive. For example, in order to select removable drive F:, expand node **Removable drives** and check the box for drive F:.

• If you would like to include only a single folder or file on the drive, select the check box next to the name of that folder or file.

4. Click the **Save** button.

Protection scope settings window will be closed. Your newly configured settings have been saved.

► **To create a protection scope using the network file resources list:**

1. Open the **Protection scope settings** window (see Section "Opening the Real-Time File Protection scope settings" on page 259).

2. To include individual nodes in the protection scope, clear the **My Computer** check box and do the following:
   a. Open the context menu on the protection scope by right-clicking it.
   b. In the context menu of the button, select **Add protection scope**.
   c. In the **Add protection scope** window select an object type to add it to a protection scope:
      • **Predefined scope** to include one of the predefined scopes into protection scope on the server. Then in the drop down list select a necessary protection scope.
      • **Disk, folder or network location** to include individual drive, folder or a network object into a protection scope. Then select a necessary scope by clicking the **Browse** button.
      • **File** to include an individual file into protection scope. Then select a necessary scope by clicking the **Browse** button.

   You cannot add an object into protection scope if it has already been added as an exclusion out of a protection scope.

3. To exclude individual nodes from the protection scope, clear check boxes next to the names of these nodes or take the following steps:
   a. Open the context menu on the protection scope by right-clicking it.
   b. In the context menu select **Add exclusion** option.
   c. In the **Add exclusion** window select an object type that you want to add as an exclusion out of the protection scope following the logic of the adding object to a protection scope procedure.

4. To modify the protection scope or an exclusion added, select the **Edit scope** option in the context menu for the necessary protection scope.
5. To hide the previously added protection scope or an exclusion in the list of network file resources, select the **Remove from the list** option in the context menu for the necessary protection scope.

   The protection scope is excluded out of the Real-Time File Protection task scope on its removal from the network file resources list.

6. Click the **Save** button.

   Protection scope settings window will be closed. Your newly configured settings have been saved.

   The *Real-Time File Protection* task can be started if at least one of the computer file resource nodes is included into a protection scope.

If a complex protection scope is specified, for example, if different security values for settings for multiple nodes in the server file resource tree are specified, this may slow the scanning of objects when they are accessed.

### Creating virtual protection scope

You can expand the protection / scan scope by adding individual virtual drives, folders, or files only if the protection / scan scope is presented as a tree of file resources (see Section "Configuring view mode for network file resources" on page 479).

► **To add a virtual drive to the protection scope:**

1. Open the Protection scope settings window (see Section "Opening the Real-Time File Protection scope settings" on page 259).
2. Open the drop-down list in the window upper left sector and select **Tree-view**.
3. Open the context menu of the Virtual drives.
4. Select the **Add virtual drive** option.
5. In the list of available names, select the name for the virtual drive that is being created.
6. Enable the check box next to the drive added to include the drive in the protection scope.
7. In the Protection scope settings window, click the **Save** button.

   Your newly configured settings have been saved.

► **To add a virtual folder or virtual file to the protection scope:**

1. Open the Protection scope settings window (see Section "Opening the Real-Time File Protection scope settings" on page 259).
2. Open the drop-down list in the window upper left sector and select **Tree-view**.
3. Open the context menu for the virtual drive to which you want to add a folder or a file, and select one of the following options:
   - Add virtual folder if you want to add a virtual folder to the protection scope.
   - Add virtual file if you want to add a virtual file to the protection scope.

4. In the entry field specify the name of the folder or file.

5. In the line containing the name of the created folder or file, select the check box to include the folder or file in the protection scope.

6. In the Protection scope settings window, click the Save button.
   The modified task settings are saved.

Configuring security settings manually

By default Real-Time Server Protection tasks use common security settings for the entire protection scope. These settings correspond to the Recommended predefined security level (see Section "Predefined security levels" on page 240).

The default values of security settings can be modified by configuring them as common settings for the entire protection scope or as different settings for different items in the server file resource list or nodes in the tree.

When working with the server file resources tree, security settings that are configured for the selected parent node are automatically applied to all child nodes. The security settings of the parent node are not applied to child nodes that are configured separately.

To configure security settings manually:

1. Open the Protection scope settings window (see Section "Opening the Real-Time File Protection scope settings" on page 259).

2. In the left window section select the node to configure security settings.

   A predefined template containing security settings (see Section "About security settings templates" on page 159) can be applied for a selected node or item in the protection scope.

3. Configure the required security settings of the selected node or item in accordance with your requirements:
   - General (see Section "Configuring general task settings" on page 268)
   - Actions (see Section "Configuring actions" on page 270)
   - Performance (see Section "Configuring performance" on page 272)

4. In the Protection scope settings window, click the Save button.
   New protection scope settings are saved.
Configuring general task settings

To configure the general security settings of the Real-Time File Protection task:

1. Open the Protection scope settings window (see Section "Opening the Real-Time File Protection scope settings" on page 259).
2. Select the General tab.
3. In the Objects protection section, specify the objects that you want to include in the protection scope:
   - **All objects**
     Kaspersky Security for Windows Server scans all objects.
   - **Objects scanned by format**
     Kaspersky Security for Windows Server scans only infectable objects based on file format.
     Kaspersky Lab compiles the list of formats. It is included in the Kaspersky Security for Windows Server databases.
   - **Objects scanned according to list of extensions specified in anti-virus database**
     Kaspersky Security for Windows Server scans only infectable objects based on file extension.
     Kaspersky Lab compiles the list of extensions. It is included in the Kaspersky Security for Windows Server databases.
   - **Objects scanned by specified list of extensions**
     Kaspersky Security for Windows Server scans files based on file extension. List of file extensions can be manually customized in the List of extensions window, which can be opened by clicking the Edit button.
   - **Scan disk boot sectors and MBR**
     Enables protection of boot sectors and master boot records.
     If the check box is selected, Kaspersky Security for Windows Server scans boot sectors and master boot records on hard drives and removable drives of the server.
     The check box is selected by default.
• **Scan alternate NTFS streams**

  Scanning of alternative file and folder streams on the NTFS file system drives.

  If the check box is selected, the application scans a probably infected object and all NTFS streams associated with that object.

  If the check box is cleared, the application scans only the object that was detected and considered as probably infected.

  The check box is selected by default.

4. In the **Performance** section, select or clear the **Protect only new and modified files** check box.

   This check box enables/disables scanning and protection of files that have been recognized by Kaspersky Security for Windows Server as new or modified since the last scan.

   If the check box is selected, Kaspersky Security for Windows Server scans and protects only the files that it has recognized as new or modified since the last scan.

   If the check box is cleared, you can select if you want to scan and protect only new files or all files disregarding their modification status.

   By default, the check box is selected for the **Maximum performance** security level. If the **Maximum protection** or **Recommended** security levels are set, the check box is cleared.

   To switch between available options when the check box is cleared, click on the **All / Only new** link for each of the compound object types.

5. In the **Compound objects protection** section, specify the compound objects that you want to include in the protection scope:

   • **All / Only new archives**

     Scanning of ZIP, CAB, RAR, ARJ archives and other archive formats.

     If this check box is selected, Kaspersky Security for Windows Server scans archives.

     If this check box is cleared, Kaspersky Security for Windows Server skips archives during scanning.

     The default value depends on the selected protection level.

   • **All / Only new SFX archives**

     Scanning of self-extracting archives.

     If this check box is selected, Kaspersky Security for Windows Server scans SFX archives.

     If this check box is cleared, Kaspersky Security for Windows Server skips SFX archives during scanning.

     The default value depends on the selected protection level.

     This option is active when the **Archives** check box is cleared.

   • **All / Only new email databases**

     Scanning of Microsoft Outlook and Microsoft Outlook Express mail database files.

     If this check box is selected, Kaspersky Security for Windows Server scans mail database files.
If this check box is cleared, Kaspersky Security for Windows Server skips mail database files during scanning.

The default value depends on the selected security level.

- **All / Only new packed objects**
  Scanning of executable files packed by binary code packers, such as UPX or ASPack.

  If this check box is selected, Kaspersky Security for Windows Server scans executable files packed by packers.

  If this check box is cleared, Kaspersky Security for Windows Server skips executable files packed by packers during scanning.

  The default value depends on the selected protection level.

- **All / Only new plain email**
  Scanning of files of mail formats, such as Microsoft Outlook and Microsoft Outlook Express messages.

  If this check box is selected, Kaspersky Security for Windows Server scans files of mail formats.

  If this check box is cleared, Kaspersky Security for Windows Server skips files of mail formats during scanning.

  The default value depends on the selected security level.

- **All / Only new embedded OLE objects**
  Scanning of objects embedded into files (such as Microsoft Word macros, or email message attachments).

  If this check box is selected, Kaspersky Security for Windows Server scans objects embedded into files.

  If this check box is cleared, Kaspersky Security for Windows Server skips objects embedded into files during scanning.

  The default value depends on the selected protection level.

6. Click **Save**.

   New task configuration will be saved.

**Configuring actions**

- *To configure the actions on infected and other detected objects for the Real-Time File Protection task:*

  1. Open the **Protection scope settings** window (see Section “Opening the Real-Time File Protection scope settings” on page 259).

  2. Select the **Actions** tab.
3. Select the action to be performed on infected and other detected objects:
   
   - **Notify only.**
     
     When this mode is selected, Kaspersky Security for Windows Server does not block access to detected or other detected objects, or perform any actions on them. The following event is registered in the task log: *Object not disinfected. Reason: no action was taken to neutralize detected object due to user-defined settings.* The event specifies all available information about the detected object.
     
     The **Notify only** mode should be separately configured for each protection or scan area. This mode is not used by default on any of the security levels. If you select this mode, Kaspersky Security for Windows Server automatically changes the security level to **Custom.**
   
   - **Block access.**
     
     When this option is selected Kaspersky Security for Windows Server blocks access to the detected or probably infected object. You can select additional action over blocked objects in the drop-down list.
   
   - **Perform additional action.**
     
     Select the action from the drop-down list:
     
     - **Disinfect.**
     - **Disinfect. Remove if disinfection fails.**
     - **Remove.**
     - **Recommended.**

4. Select the action to be performed on probably infected objects:
   
   - **Notify only.**
     
     When this mode is selected, Kaspersky Security for Windows Server does not block access to detected or other detected objects, or perform any actions on them. The following event is registered in the task log: *Object not disinfected. Reason: no action was taken to neutralize detected object due to user-defined settings.* The event specifies all available information about the detected object.
     
     The **Notify only** mode should be separately configured for each protection or scan area. This mode is not used by default on any of the security levels. If you select this mode, Kaspersky Security for Windows Server automatically changes the security level to **Custom.**
   
   - **Block access.**
     
     When this option is selected Kaspersky Security for Windows Server blocks access to the detected or probably infected object. You can select additional action over blocked objects in the drop-down list.
   
   - **Perform additional action.**
     
     Select the action from the drop-down list:
     
     - **Quarantine.**
     - **Remove.**
     - **Recommended.**

5. Configure actions to be performed on objects depending on the type of object detected:
a. Clear or select the **Perform actions depending on the type of object detected** check box.

   If the check box is selected, you can independently set primary and secondary action for each detected object type by clicking the **Settings** button next to the check box. At that, Kaspersky Security for Windows Server will not allow to open or execute an infected object regardless of your choice.

   If the check box is cleared, Kaspersky Security for Windows Server performs actions that are selected in the **Action to perform on infected and other objects** and **Action to perform on probably infected objects** sections for named object types respectively.

   The check box is cleared by default.

b. Click the **Settings** button.

c. In the window that opens select first and secondary action (if the first action fails) for each type of the detected object.

d. Click **OK**.

6. Select the action to perform on unmodifiable compound files: select or clear the **Entirely remove compound file that cannot be modified by the application in case of embedded object detect** check box.

   This check box enables or disables forced removal of the parent compound file when a malicious, probably infected or other detected child embedded object is detected.

   If the check box is selected and the task is configured to remove infected and probably infected objects, Kaspersky Security for Windows Server forcibly removes the entire parent compound object when a malicious or other embedded object is detected. Enforced removal of a parent file along with all of its contents happens if the application cannot remove only the detected child object (for example, if the parent object is unmodifiable).

   If this check box is cleared and the task is configured to remove infected and probably infected objects, Kaspersky Security for Windows Server does not perform the selected action, if the parent object is unmodifiable.

7. Click **Save**.

   New task configuration will be saved.

### Configuring performance

▶ **To configure the performance for the Real-Time File Protection task:**

1. Open the **Protection scope settings** window (see Section "Opening the Real-Time File Protection scope settings" on page 259).
2. Select the **Performance** tab.
3. In the **Exclusions** section:
   - Clear or select the **Exclude files** check box.

   Excluding files from scanning by file name or file name mask.

   If this check box is selected, Kaspersky Security for Windows Server skips specified objects during scanning.
If this check box is cleared, Kaspersky Security for Windows Server scans all objects. The check box is cleared by default.

- Clear or select the Do not detect check box.
  
  Objects are excluded from scanning by the name or name mask of the detectable object. The list of names of detectable objects is available on the Virus Encyclopedia [https://encyclopedia.kaspersky.com/knowledge/classification/](https://encyclopedia.kaspersky.com/knowledge/classification/) website.

  If this check box is selected, Kaspersky Security for Windows Server skips specified detectable objects during scanning.

  If the check box is cleared, Kaspersky Security for Windows Server detects all objects specified in the application by default.

  The check box is cleared by default.

- Click the Edit button for each setting to add exclusions.

4. In the Advanced settings section:

- **Stop scanning if it takes longer than (sec.)**
  
  Limits the duration of object scanning. The default value is 60 seconds.

  If the check box is cleared, scan duration is limited to the specified value.

  If the check box is cleared, scan duration is unlimited.

  By default, the check box is selected for the Maximum performance security level.

- **Do not scan compound objects larger than (MB)**
  
  Excludes objects larger than the specified size from the scanning.

  If the check box is selected, Kaspersky Security for Windows Server skips compound objects whose size exceeds the specified limit during virus scan.

  If this check box is cleared, Kaspersky Security for Windows Server scans compound objects of any size.

  By default, the check box is selected for the Maximum performance security level.

- **Use iSwift technology**
  
  iSwift compares file NTFS identifier, that is stored in a database, with a current identifier. The scanning is performed only for files, whose identifiers has changed (new files and files modified since the last scan of NTFS system objects).

  If the check box is selected, Kaspersky Security for Windows Server scans only new files or those modified since the last scan of NTFS system objects.

  If the check box is cleared, Kaspersky Security for Windows Server scans objects of NTFS file system disregarding the date of file creation or modification except for files from network folders.

  The check box is selected by default.
Real-Time File Protection

- **Use iChecker technology**
  
iChecker calculates and remembers checksums of scanned files. If an object is modified the checksum changes. The application compares all checksums during the scan task and scans only new and modified since the last scan files.

  If the check box is selected, Kaspersky Security for Windows Server scans only new and modified files.

  If the check box is cleared, Kaspersky Security for Windows Server scans files disregarding the date of file creation or modification.

  The check box is selected by default.

### Real-Time File Protection task statistics

While the Real-Time File Protection task is being executed, you can view detailed real-time information about the number of objects processed by Kaspersky Security for Windows Server since the task was started until the current moment.

- **To view the statistics of a Real-Time File Protection task, take the following steps:**
  1. In the Application Console tree, expand the **Real-Time Server Protection** node.
  2. Select the **Real-Time File Protection** child node.

    Task statistics are displayed in the **Statistics** section of the details pane of the selected node.

The information can be viewed about objects processed by Kaspersky Security for Windows Server since it was started until the current moment (see the table below):

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Detected</td>
<td>Number of objects detected by Kaspersky Security for Windows Server. For example, if Kaspersky Security for Windows Server detects one malware in five files, the value in this field increases by one.</td>
</tr>
<tr>
<td>Infected and other objects detected</td>
<td>Number of objects that Kaspersky Security for Windows Server found and classified as infected or number of found legitimate software files that can be used by intruders to damage your computer or personal data.</td>
</tr>
<tr>
<td>Probably infected objects detected</td>
<td>Number of objects found by Kaspersky Security for Windows Server to be probably infected.</td>
</tr>
</tbody>
</table>
| Objects not disinfected       | Number of objects which Kaspersky Security for Windows Server did not disinfect for the following reasons:  
  - The type of detected object cannot be disinfected.  
  - An error occurred during disinfection. |
<p>| Objects not moved to Quarantine | The number of objects that Kaspersky Security for Windows Server attempted to quarantine but was unable to do so, for example, due to insufficient disk space. |
| Objects not removed           | The number of objects that Kaspersky Security for Windows Server attempted but was unable to delete, because, for example, access to the object was blocked by another application. |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Objects not scanned</td>
<td>The number of objects in the protection scope that Kaspersky Security for Windows Server failed to scan because, for example, access to the object was blocked by another application.</td>
</tr>
<tr>
<td>Objects not backed up</td>
<td>The number of objects the copies of which Kaspersky Security for Windows Server attempted to save in Backup but was unable to do so, for example, due to insufficient disk space.</td>
</tr>
<tr>
<td>Processing errors</td>
<td>Number of objects whose processing resulted in an error.</td>
</tr>
<tr>
<td>Objects disinfected</td>
<td>Number of objects disinfected by Kaspersky Security for Windows Server.</td>
</tr>
<tr>
<td>Moved to Quarantine</td>
<td>Number of objects quarantined by Kaspersky Security for Windows Server.</td>
</tr>
<tr>
<td>Moved to Backup</td>
<td>The number of object copies that Kaspersky Security for Windows Server saved to Backup.</td>
</tr>
<tr>
<td>Objects removed</td>
<td>Number of objects removed by Kaspersky Security for Windows Server.</td>
</tr>
<tr>
<td>Password-protected objects</td>
<td>Number of objects (archives, for example) that Kaspersky Security for Windows Server missed because they were password protected.</td>
</tr>
<tr>
<td>Corrupted objects</td>
<td>The number of objects skipped by Kaspersky Security for Windows Server as their format was corrupted.</td>
</tr>
<tr>
<td>Objects processed</td>
<td>Total number of objects processed by Kaspersky Security for Windows Server.</td>
</tr>
</tbody>
</table>

You can view the Real-Time File Protection task statistics in the task log by clicking the **Open task log** in the **Management** section in the detail pane.

If the value of the **Total events: %d** field in the Real-Time Protection task log window exceeds 0, it is recommended to process the events appeared in the task log on the **Events** tab manually.
Script Monitoring

This section contains information about the Script Monitoring task and how to configure it.

</table>

About the Script Monitoring task

When the Script Monitoring task is running, Kaspersky Security for Windows Server controls the execution of scripts created using Microsoft Windows Script Technologies (or Active Scripting) such as VBScript or JScript®. The application can also process PowerShell™ scripts and scripts run in the Microsoft Office applications on operating systems with Antimalware Scan Interface (AMSI) installed. You can allow or block the execution of a script that has been found to be dangerous or probably dangerous. If Kaspersky Security for Windows Server identifies the script as potentially dangerous, it blocks or allows the execution of the script, in accordance with your selected action. If the Block action is selected, the application allows script execution only if this script has been found to be safe.

Starting from the Microsoft Windows Server 2016 operating system, Kaspersky Security for Windows Server supports the Antimalware Scan Interface (AMSI). AMSI allows applications and services to integrate with any antimalware application installed on a computer in order for all the executed scripts to be intercepted and scanned by the antimalware.

By default, the Script Monitoring component is not installed on the server as part of the application. When the Script Monitoring component is installed the application is registered as AMSI provider and starts to monitor executed scripts.

On the computers running operating systems that do not support the AMSI feature the use of this component may be incompatible with some of the third-party applications installed on the protected server. In this case monitoring of third-party scripts can lead to scripts’ operational errors. It is recommended either not to use such third-party applications, or to disable the Script Monitoring task. If the task is disabled, the risks associated with scripts execution security are increasing.

If you want to use the Script Monitoring component, you must manually select it in the list of installed components during installation of Kaspersky Security for Windows Server. If the component is installed, the Script Monitoring task is automatically started at Kaspersky Security for Windows Server start by default.

Detailed information about selecting application components during installation is provided in the Kaspersky Security for Windows Server Administrator's Guide installation sections.

You can configure the Script Monitoring task settings (see Section "Configuring Script Monitoring task settings via the Application Console" on page 279).

Default Script Monitoring task settings

The Script Monitoring system task uses the default settings described in the table below. You can change the values of these settings.

<table>
<thead>
<tr>
<th>Setting</th>

</tbody>
</table>

Configuring Script Monitoring task settings via the Administration Plug-in

► To configure a Script Monitoring task:

1. Expand the Managed devices node in the Kaspersky Security Center Administration Console tree.
2. Select the administration group for which you want to configure application settings.
3. Perform one of the following actions in the details pane of the selected administration group:
   - To configure application settings for a group of servers, select the Policies tab and open the Properties: <Policy name> window (see Section "Configuring policy" on page 119).
   - To configure the application for a single server, select the Devices tab and open the Application settings window (see Section "Configuring local tasks in the Application settings window of the Kaspersky Security Center" on page 124).

If an active Kaspersky Security Center policy is applied to a device, and this policy blocks changes to application settings, then these settings cannot be edited in the Application settings window.
4. In the Real-time server protection section of the Properties: <Policy name> window, click Settings for Script Monitoring.

5. In the Action to perform on dangerous scripts section in the General tab, do one of the following:
   - To allow execution of probably dangerous scripts, select Allow. Kaspersky Security for Windows Server allows execution of a probably dangerous script.
   - To prohibit execution of probably dangerous scripts, select Block. Kaspersky Security for Windows Server blocks execution of a probably dangerous script. This option is selected by default.

6. In the Heuristic Analyzer section, do one of the following:
   - Clear or select the Use heuristic analyzer check box. This check box enables / disables Heuristic Analyzer during object scanning.
     If the check box is selected, Heuristic Analyzer is enabled.
     If the check box is cleared, Heuristic Analyzer is disabled.
     The check box is selected by default.
   - If necessary, adjust the level of analysis using the slider. The slider allows you to adjust the heuristic analysis level. The scanning intensity level sets the balance between the thoroughness of searches for threats, the load on the operating system's resources and the time required for scanning.
     The following scanning intensity levels are available:
     - Light. Heuristic analyzer performs fewer operations found inside executable files. The probability of threat detection in this mode is somewhat lower. Scanning is faster and less resource-intensive.
     - Medium. Heuristic Analyzer performs the number of instructions found within executable files recommended by the experts of Kaspersky Lab. This level is selected by default.
     - Deep. Heuristic analyzer performs more operations found in executable files. The probability of threat detection in this mode is higher. The scan uses up more system resources, takes more time, and can cause a higher number of false alarms. The slider is available if the Use heuristic analyzer check box is selected.

7. In the Trusted Zone section, select or clear the Apply Trusted Zone check box. This check box enables / disables use of the Trusted Zone for a task.
   - If the check box is selected, Kaspersky Security for Windows Server will consider exclusions specified by their location and / or an object detected by name or name mask in the Trusted Zone exclusion list.
   - If the check box is cleared, Kaspersky Security for Windows Server disregards the exclusions for the Script Monitoring task.
     The check box is selected by default.

8. Click OK. The newly configured settings are applied.
Configuring Script Monitoring task settings via the Application Console

► To configure a Script Monitoring task:

1. In the Application Console tree, expand the Real-Time Server Protection node.
2. Select the Script Monitoring child node.
3. Click the Properties link in the details pane of the node. The Task settings window opens on the General tab.
4. In the Action to perform on dangerous scripts section, do one of the following:
   - To allow execution of probably dangerous scripts, select Allow. Kaspersky Security for Windows Server allows execution of a probably dangerous script.
   - To prohibit execution of probably dangerous scripts, select Block. Kaspersky Security for Windows Server blocks execution of a probably dangerous script. This option is selected by default.
5. In the Heuristic analyzer section, do one of the following:
   - Clear or select the Use heuristic analyzer check box. This check box enables / disables Heuristic Analyzer during object scanning. If the check box is selected, Heuristic Analyzer is enabled. If the check box is cleared, Heuristic Analyzer is disabled. The check box is selected by default.
   - If necessary, adjust the level of analysis using the slider. The slider allows you to adjust the heuristic analysis level. The scanning intensity level sets the balance between the thoroughness of searches for threats, the load on the operating system's resources and the time required for scanning. The following scanning intensity levels are available:
     - **Light.** Heuristic analyzer performs fewer operations found inside executable files. The probability of threat detection in this mode is somewhat lower. Scanning is faster and less resource-intensive.
     - **Medium.** Heuristic Analyzer performs the number of instructions found within executable files recommended by the experts of Kaspersky Lab. This level is selected by default.
     - **Deep.** Heuristic analyzer performs more operations found in executable files. The probability of threat detection in this mode is higher. The scan uses up more system resources, takes more time, and can cause a higher number of false alarms. The slider is available if the Use heuristic analyzer check box is selected.
6. In the Trusted Zone section, select or clear the Apply Trusted Zone check box. This check box enables / disables use of the Trusted Zone for a task. If the check box is selected, Kaspersky Security for Windows Server will consider exclusions specified by their location and / or an object detected by name or name mask in the Trusted Zone exclusion list.
If the check box is cleared, Kaspersky Security for Windows Server disregards the exclusions for the Script Monitoring task.

The check box is selected by default.

7. Click **OK**.

The newly configured settings are applied.

## Script Monitoring task statistics

While the Script Monitoring task is running, you can view information about the number of scripts processed by Kaspersky Security for Windows Server from the time when the task was started until now.

> To view Script Monitoring task statistics:

1. In the Application Console tree, expand the **Real-Time Server Protection** node.
2. Select the **Script Monitoring** child node.

Current task statistics are displayed in the details pane of the node in **Management** and **Statistics** sections.

You can view information about objects processed by Kaspersky Security for Windows Server since the task was started (see the table below).

About the KSN Usage task

*Kaspersky Security Network* (also referred to as "KSN") is an infrastructure of online services providing access to Kaspersky Lab's operative knowledge base on the reputation of files, web resources and programs. Kaspersky Security Network allows Kaspersky Security for Windows Server to react very promptly to new threats, improves the performance of several protection components, and reduces the likelihood of false positives.

To start the KSN Usage task, you must accept the Kaspersky Security Network Statement.

Information received by Kaspersky Security for Windows Server from Kaspersky Security Network pertains only to the reputation of programs and URLs.

Participation in KSN allows Kaspersky Lab to receive real-time information about types and sources of new threats, develop ways to neutralize them, and reduce the number of false positives in application components.

More detailed information about the transferring, processing, storage, and destruction of information about application usage is available in the Data handling window of the KSN Usage task, and in the Privacy Policy on the Kaspersky Lab's website.

Kaspersky Security Network can be used in the following Kaspersky Security for Windows Server tasks:

- Real-Time File Protection.
- On-Demand Scan.
- Applications Launch Control.
- RPC Network Storage Protection.
- ICAP Network Storage Protection.

**Kaspersky Private Security Network**

See details about how to configure Kaspersky Private Security Network (hereinafter referred to "Private KSN") in the Kaspersky Security Center Help.

If you use Private KSN on the protected server, in the **Data handling** window (see Section "Configuring Data handling via the Administration Plug-in" on page 285) of the KSN Usage task you can read the KSN Statement and enable the task by selecting the **I accept the Kaspersky Private Security Network Statement** check box. By accepting the terms you agree to send all types of data mentioned in KSN Statement (security requests, statistical data) to KSN services.

After accepting the Private KSN terms, the check boxes that adjust the Global KSN usage are not available.

If you disable Private KSN when the KSN Usage task is running, the **License violation** error occurs and the task stops. To continue protecting the server you need to accept the KSN Statement in the **Data handling** window and restart the task.

**Withdrawal of the KSN Statement acceptance**

You can withdraw the acceptance and stop any data exchange with the Kaspersky Security Network at any moment. The following actions are considered as the full or partial withdrawal of KSN Statement:

- Clearing the **Send data about scanned files** check box: the application stops sending checksums of scanned files to KSN service for analysis.
- Clearing the **Send data about scanned URLs** check box: the application stops sending URLs for analysis.
- Clearing the **Send Kaspersky Security Network statistics** check box: the application stops processing data with additional KSN statistics.
- Clearing the **I accept the terms of the Kaspersky Security Network Statement** check box: the application stops all KSN-related data processing, the KSN Usage task stops.
- Clearing the **I accept the terms of the Kaspersky Managed Protection Statement** check box: the KMP service will be disabled.
- Uninstalling the KSN Usage component: all KSN-related data processing stops.
- Uninstalling the Kaspersky Security for Windows Server: all KSN-related data processing stops.
Default KSN Usage task settings

You can change the default settings of the KSN Usage task (see the table below).

<table>
<thead>
<tr>
<th>Setting</th>
<th>Default Value</th>

Managing KSN Usage via the Administration Plug-In

In this section, learn how configure the KSN Usage task and Data Handling via the Administration Plug-In.

In this section
- Configuring the KSN Usage task via the Administration Plug-in ........................................... 283
- Configuring Data handling via the Administration Plug-in ......................................................... 285

Configuring the KSN Usage task via the Administration Plug-in

To configure the KSN Usage task, take the following steps:

1. Expand the Managed devices node in the Kaspersky Security Center Administration Console tree.
2. Select the administration group for which you want to configure application settings.
3. Perform one of the following actions in the details pane of the selected administration group:
   - To configure application settings for a group of servers, select the Policies tab and open the Properties: <Policy name> window (see Section “Configuring policy” on page 119).
   - To configure the application for a single server, select the Devices tab and open the Application settings window (see Section “Configuring local tasks in the Application settings window of the Kaspersky Security Center” on page 124).
4. In the **Real-Time Server Protection** section, click the **Settings** button in the **KSN Usage** subsection. The **KSN Usage** window opens.

5. On the **General** tab, configure the following task settings:

   - **In the Action to perform on KSN untrusted objects** section, specify the action that Kaspersky Security for Windows Server is to perform if it detects an object identified by KSN as untrusted:
     - **Remove**
       Kaspersky Security for Windows Server deletes the object with KSN-untrusted status and places a copy of it in Backup.
       This option is selected by default.
     - **Log information**

   - **In the Data transfer section, restrict the size of files for which the checksum is calculated:**
     - Clear or select the **Do not calculate checksum before sending to KSN if file size exceeds (MB)** check box.
       This check box enables or disables calculation of the checksum for files of the specified size for delivery of this information to the KSN service.
       The duration of the checksum calculation depends on the file size.
       If this check box is selected, Kaspersky Security for Windows Server does not calculate the checksum for files that exceed the specified size (in MB).
       If the check box is cleared, Kaspersky Security for Windows Server calculates the checksum for files of any size.
       The check box is selected by default.

   - **If required, in the field to the right, change the maximum size of files for which Kaspersky Security for Windows Server calculates the checksum.**

   - **In the KSN Proxy section, clear or select the Use Kaspersky Security Center as KSN Proxy check box.**
     The check box allows to manage the data transfer between the protected servers and KSN.
     If the check box is cleared the data from the Administration Server and protected servers is sent to KSN directly (not via the Kaspersky Security Center). The active policy defines which type of data can be sent to KSN directly.
     If the check box is selected, all data is sent to KSN via the Kaspersky Security Center.
     The check box is selected by default.
To enable KSN Proxy the KSN Statement must be accepted and Kaspersky Security Center properly configured. See Kaspersky Security Center Help for more details.

6. If needed, configure the task start schedule on the Task management tab. For example, you can start the task by schedule and specify the At application launch frequency, if you want the task to run automatically when the server is restarted.

The application will automatically start the KSN Usage task by schedule.

7. Configure the data handling (see Section "Configuring Data handling via the Administration Plug-in" on page 285) before starting the task.

8. Click OK.

The modified settings are applied. The date and time of modifying the settings, as well as information about the task settings before and after modification, are saved in the system audit log.

### Configuring Data handling via the Administration Plug-in

You can change the default data handling settings (see the table below).

<table>
<thead>
<tr>
<th>Setting</th>
<th>Default Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>I accept the terms of the Kaspersky Security Network Statement</td>
<td>Cleared</td>
<td>If selected, participation in KSN after the installation is accepted. You can change your decision at any moment.</td>
</tr>
<tr>
<td>Send Kaspersky Security Network statistics</td>
<td>Selected (applied only if the KSN Statement is accepted)</td>
<td>If the KSN Statement is accepted, the KSN Statistics will be sent automatically, unless you clear the check box.</td>
</tr>
<tr>
<td>Send data about scanned files</td>
<td>Selected (applied only if the KSN Statement is accepted)</td>
<td>If the KSN Statement is accepted, the data about files that were scanned and analyzed since the task has been started, is sent. You can clear the check box at any time.</td>
</tr>
<tr>
<td>Send data about scanned URLs</td>
<td>Selected (applied only if the KSN Statement is accepted)</td>
<td>If the KSN Statement is accepted, the application sends information about the accessed URLs to Kaspersky Lab.</td>
</tr>
<tr>
<td>Accept the terms of the Kaspersky Managed Protection Statement</td>
<td>Cleared</td>
<td>You can enable or disable the KMP service. The service available only if the additional agreement has been signed during the application purchase process.</td>
</tr>
</tbody>
</table>

To configure what data will be processed by the KSN services and accept the KSN Statement:

1. Expand the Managed devices node in the Kaspersky Security Center Administration Console tree.
2. Select the administration group for which you want to configure application settings.
3. Perform one of the following actions in the details pane of the selected administration group:
   - To configure application settings for a group of servers, select the Policies tab and open the Properties: <Policy name> window (see Section "Configuring policy" on page 119).
   - To configure the application for a single server, select the Devices tab and open the Application settings window (see Section "Configuring local tasks in the Application settings window of the Kaspersky Security Center" on page 124).

   If an active Kaspersky Security Center policy is applied to a device, and this policy blocks changes to application settings, then these settings cannot be edited in the Application settings window.

4. In the Real-Time Server Protection section click the Data handling button in the KSN Usage subsection. The Data handling window opens.

5. On the Statistics and services tab, read the Statement and select the I accept the terms of the Kaspersky Security Network Statement check box.

6. To increase the protection level, the following check boxes are automatically selected:
   - **Send data about scanned files.**
     - If the check box is selected, Kaspersky Security for Windows Server sends the checksum of scanned files to the Kaspersky Lab. Conclusion about each file security is based on the reputation received from KSN.
     - If the check box is cleared, Kaspersky Security for Windows Server does not send checksum of files to KSN.
     - Note, than the file reputation requests might be sent in a limited mode. The limitations are used for protection of the Kaspersky Lab reputation servers from the DDoS attacks. In this scenario, the parameters of file reputation requests, that are being sent, are defined by the rules and methods established by the Kaspersky Lab experts and cannot be configured by user on a protected server. Updates of these rules and methods are received along with the application database updates. If the limitations are applied, the Enabled by Kaspersky Lab for protecting KSN servers against DDoS status is displayed in the KSN Usage task statistics.
     - The check box is selected by default.
   - **Send data about scanned URLs.**
     - If the check box is selected, Kaspersky Security for Windows Server sends the data about requested web resources, including web addresses, to the Kaspersky Lab. Conclusion about the requested web resource security is based on the reputation received from KSN.
     - If the check box is cleared, Kaspersky Security for Windows Server does not check URLs reputation in KSN.
     - The check box is selected by default.
     - The check box influences the Traffic Security task configuration.
     - You can clear these check boxes and stop sending additional data at any moment.

7. The Send Kaspersky Security Network statistics check box is selected by default. You can clear the check box at any time, if you don't want Kaspersky Security for Windows Server to send additional statistics to Kaspersky Lab.
If the check box is selected the Kaspersky Security for Windows Server sends additional statistics, which may contain personal data. The list of all data, that is sent as KSN statistics, is specified in the KSN Statement. The data received by Kaspersky Lab is used to improve the quality of applications and level of threat detection rates.

If the check box is cleared, Kaspersky Security for Windows Server does not send additional statistics.

The check box is selected by default.

8. On the Kaspersky Managed Protection tab, read the Statement and select the I accept the terms of the Kaspersky Managed Protection Statement check box.

If the check box is selected, you agree to send statistics on the protected server activity to the Kaspersky Lab specialists. Received data is used for around-the-clock analysis and reporting, required to prevent security breach incidents.

The check box is cleared by default.

The changes of I accept the terms of the Kaspersky Managed Protection Statement check box state do not start or stop the processing of data immediately. To apply the changes you must restart Kaspersky Security for Windows Server.

To use the KMP service, you need to sign the corresponding agreement and execute configuration files on a protected server, enable I accept the terms of the Kaspersky Security Network Statement, Send data about scanned files, Send data about scanned URLs, and Send Kaspersky Security Network statistics check boxes on the Statistics and Services tab.

9. Click OK.

The data processing configuration will be saved.

Managing KSN Usage via the Application Console

In this section, learn how configure the KSN Usage task and Data handling via the Application Console.

In this section

| Configuring KSN Usage task via the Application Console | 288 |
| Configuring Data handling via the Application Console | 289 |
Configuring KSN Usage task via the Application Console

To configure the KSN Usage task, take the following steps:

1. In the Application Console tree, expand the **Real-Time Server Protection** node.
2. Select the **KSN Usage** child node.
3. Click the **Properties** link in the details pane.
   
   The **Task settings** window opens on the **General** tab.
4. Configure the task:

   - In the **Action to perform on KSN untrusted objects** section, specify the action that Kaspersky Security for Windows Server is to perform if it detects an object identified by KSN as untrusted:
     
     - **Remove**
       
       Kaspersky Security for Windows Server deletes the object with KSN-untrusted status and places a copy of it in Backup.
       
       This option is selected by default.
     
     - **Log information**
       
   
   - In the **Data transfer** section, restrict the size of files for which the checksum is calculated:
     
     - Clear or select the **Do not calculate checksum before sending to KSN if file size exceeds (MB)** check box.
       
       This check box enables or disables calculation of the checksum for files of the specified size for delivery of this information to the KSN service.
       
       The duration of the checksum calculation depends on the file size.
       
       If this check box is selected, Kaspersky Security for Windows Server does not calculate the checksum for files that exceed the specified size (in MB).
       
       If the check box is cleared, Kaspersky Security for Windows Server calculates the checksum for files of any size.
       
       The check box is selected by default.
     
     - If required, in the field to the right, change the maximum size of files for which Kaspersky Security for Windows Server calculates the checksum.
   
5. If needed, configure the task start schedule on the **Schedule** and **Advanced** tabs. For example, you can enable task start by schedule and specify the start frequency of the **At application launch** if you want the task to run automatically when the server is restarted.

   The application will automatically start the KSN Usage task by schedule.
6. Configure the Data handling (see Section "Configuring Data handling via the Application Console" on page 289) before starting the task.
7. Click **OK**.

The modified settings are applied. The date and time of modifying the settings, as well as information about the task settings before and after modification, are saved in the system audit log.
Configuring Data handling via the Application Console

You can change the default data handling settings (see the table below).

<table>
<thead>
<tr>
<th>Setting</th>
<th>Default Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>I accept the terms of the Kaspersky Security Network Statement</td>
<td>Cleared</td>
<td>If selected, participation in KSN after the installation is accepted. You can change your decision at any moment.</td>
</tr>
<tr>
<td>Send Kaspersky Security Network statistics</td>
<td>Selected (applied only if the KSN Statement is accepted)</td>
<td>If the KSN Statement is accepted, the KSN Statistics will be sent automatically, unless you clear the check box.</td>
</tr>
<tr>
<td>Send data about scanned files</td>
<td>Selected (applied only if the KSN Statement is accepted)</td>
<td>If the KSN Statement is accepted, the data about files that were scanned and analyzed since the task has been started, is sent. You can clear the check box at any time.</td>
</tr>
<tr>
<td>Send data about scanned URLs</td>
<td>Selected (applied only if the KSN Statement is accepted)</td>
<td>If the KSN Statement is accepted, the application sends information about the accessed URLs to Kaspersky Lab.</td>
</tr>
<tr>
<td>Accept the terms of the Kaspersky Managed Protection Statement</td>
<td>Cleared</td>
<td>You can enable or disable the KMP service. The service available only if the additional agreement has been signed during the application purchase process.</td>
</tr>
</tbody>
</table>

To configure what data will be processed by the KSN services and accept the KSN Statement:

1. In the Application Console tree, expand the Real-Time Server Protection node.
2. Select the KSN Usage child node.
3. Click the Data handling link in the details pane. The Data handling window opens.
4. On the Statistics and services tab, read the Statement and select the I accept the terms of the Kaspersky Security Network Statement check box.
5. To increase the protection level, the following check boxes are automatically selected:
   - Send data about scanned files.
     - If the check box is selected, Kaspersky Security for Windows Server sends the checksum of scanned files to the Kaspersky Lab. Conclusion about each file security is based on the reputation received from KSN.
     - If the check box is cleared, Kaspersky Security for Windows Server does not send checksum of files to KSN.
     - Note, than the file reputation requests might be sent in a limited mode. The limitations are used for protection of the Kaspersky Lab reputation servers from the DDoS attacks. In this scenario, the parameters of file reputation requests, that are being sent, are defined by the rules and methods established by the Kaspersky Lab experts and cannot be configured by user on a protected server. Updates of these rules and methods are
received along with the application database updates. If the limitations are applied, the
Enabled by Kaspersky Lab for protecting KSN servers against DDoS status is displayed
in the KSN Usage task statistics.

The check box is selected by default.

- **Send data about scanned URLs.**

  If the check box is selected, Kaspersky Security for Windows Server sends the data
  about requested web resources, including web addresses, to the Kaspersky Lab.
  Conclusion about the requested web resource security is based on the reputation
  received from KSN.
  
  If the check box is cleared, Kaspersky Security for Windows Server does not check URLs
  reputation in KSN.
  
  The check box is selected by default.

  The check box influences the Traffic Security task configuration.

You can clear these check boxes and stop sending additional data at any moment.

6. The **Send Kaspersky Security Network statistics** check box is selected by default. You can clear the
check box at any time, if you don’t want Kaspersky Security for Windows Server to send additional
statistics to Kaspersky Lab.

   If the check box is selected the Kaspersky Security for Windows Server sends additional
statistics, which may contain personal data. The list of all data, that is sent as KSN
statistics, is specified in the KSN Statement. The data received by Kaspersky Lab is used
to improve the quality of applications and level of threat detection rates.

   If the check box is cleared, Kaspersky Security for Windows Server does not send
additional statistics.

   The check box is selected by default.

7. On the **Kaspersky Managed Protection** tab, read the Statement and select the **I accept the terms of the
Kaspersky Managed Protection Statement** check box.

   If the check box is selected, you agree to send statistics on the protected server activity to
the Kaspersky Lab specialists. Received data is used for around-the-clock analysis and
reporting, required to prevent security breach incidents.

   The check box is cleared by default.

   The changes of **I accept the terms of the Kaspersky Managed Protection Statement** check box
state do not start or stop the processing of data immediately. To apply the changes you must restart

   To use the KMP service, you need to sign the corresponding agreement and execute configuration
files on a protected server, enable **I accept the terms of the Kaspersky Security Network Statement**, **Send data about scanned files**, **Send data about scanned URLs**, and **Send Kaspersky Security Network statistics** check boxes on the **Statistics and Services** tab.

8. **Click OK.**

   The data processing configuration will be saved.
Configuring additional data transfer

Kaspersky Security for Windows Server can be configured to send the following data to Kaspersky Lab:

- Checksums of scanned files (Send data about scanned files check box).
- Data about requested web addresses and processed e-mails (Send data about scanned URLs check box).
- Additional statistics, including personal data (Send Kaspersky Security Network statistics check box).

See the "Local data handling" section of this guide for detailed information about data that is sent to Kaspersky Lab.

The corresponding check boxes can be selected or cleared (see Section "Configuring Data handling via the Application Console" on page 289) only if the I accept the terms of the Kaspersky Security Network Statement check box is selected.

By default Kaspersky Security for Windows Server sends checksums of files and additional statistics after you accept the KSN Statement.

KSN Usage task statistics

While the KSN Usage task is being executed, detailed information can be viewed in real time about the number of objects processed by Kaspersky Security for Windows Server since it was started up till now. Information about all events that occur during the task performing is recorded in the task log (see Section “About task logs” on page 208).

To view KSN Usage task statistics take the following steps:

1. In the Application Console tree, expand the Real-Time Server Protection node.
2. Select the KSN Usage child node.

Task statistics are displayed in the Statistics section of the details pane of the selected node.

You can view information about objects processed by Kaspersky Security for Windows Server since the task was started (see the table below).

Managing Traffic Security via the Application Console .................................................................................. 317

About the Traffic Security task

The Traffic Security component processes web traffic (including traffic received via the mail services) and
intercepts and scans objects transferred through web traffic to detect known computer and other threats on the
protected server. The ICAP service scans incoming traffic for threats and blocks or allows traffic depending on the
scan results and configured scan settings.

Kaspersky Security for Windows Server also detects and intercepts traffic which is requested by any processes
running under Windows Subsystem for Linux. For such processes, the Traffic Security task applies action defined
by the current task configuration.

Traffic Security is installed by default. When the installation is complete, the following services are registered and
started:

- Kaspersky Security Exploit Prevention (KAVFSWH)

The component provides the following types of protection:

- Mail threat protection:
  - Anti-phishing
  - Protection against mail-transferred malware

- Web threat protection:
  - Anti-phishing
  - Malicious URLs scan
  - Protection against web-based malware
  - Web Control:
Traffic Security modes

Traffic Security can operate in the following modes:

- **Driver Interceptor.** The application intercepts traffic with a network driver. It uses a network kernel driver to intercept and analyze all incoming traffic for the specified ports.

- **Redirector.** The application processes requests coming from the user web browser as a proxy server and redirects the received traffic to an internal ICAP-server. This mode implies additional configuration of the web browser: it is necessary to specify the address and the port for the proxy server connection.

- **External Proxy.** The application processes traffic from an external proxy server. The traffic is transferred from the external proxy server to Kaspersky Security for Windows Server. The application analyzes the traffic and recommends an action to the external proxy. Kaspersky Security for Windows Server is only compatible with proxies that transfer traffic throughout the ICAP protocol.

About Traffic Security Rules

Kaspersky Security for Windows Server lets you add and configure allowing or denying rules for certificates and web addresses, and use preset rules for categories to block unwanted content. Rules for certificates can be applied if the task is running in the **Driver Interceptor** or **Redirector** mode.

Web control

This type of control is carried out by applying allowing and denying rules for web addresses and certificates. Allowing rules have a higher priority than conclusions from KSN and signature analysis.

A URL or certificate can be allowed or blocked based on prioritized conclusions (from highest to lowest):

1. Allowing or denying rules.
2. Anti-phishing and anti-virus databases.
3. KSN.

Category-based web control

Kaspersky Security for Windows Server lets you block web addresses based on categories. You can set the level of heuristic analysis used for categorization. Category-based web control uses the preset list of categories for analysis. While the list cannot be modified, you can select categories of web resources to allow or block, or turn off category-based control. The Other category includes all web resources that do not fall under any other category in the list. If this check box is selected, Kaspersky Security for Windows Server allows all web resources that are not categorized. If the check box is cleared, all web resources are blocked.
By default Kaspersky Security for Windows Server applies only one rule: the denying rule for TOR certificates. You can uncheck the rule in the rule settings to allow TOR connections. If the rule is applied, all incoming or outgoing TOR connections will be blocked.

Traffic Security also considers the conclusions for a not-a-virus mask, which are the resources or objects that are not viruses themselves, but can be used to harm the protected server. By default Kaspersky Security for Windows Server does not apply the not-a-virus mask to categories (see Section "Configuring category-based web control" on page 315, "Configuring category-based web control" on page 329).

## Mail threat protection

The Traffic Security component scans mail in Microsoft Outlook (2010, 2013 and 2016 32-bit and 64-bit). Mail threat protection is provided through Microsoft Outlook Add-in that is installed separately from Kaspersky Security for Windows Server components.

Mail threat protection includes:

- Incoming email scanning.
- Anti-virus email scanning.
- Anti-virus scanning of attachments (including packed objects).
- Anti-phishing email scanning.
- Anti-phishing scanning of attachments (including packed objects).

If a threat is detected, Kaspersky Security for Windows Server:

- Permanently deletes infected attachments.
- Modifies the infected message body. At that, the original of the infected message body is attached as an html page along with information about the threat. If a phishing link is detected, the original of the infected message body is attached in TXT format along with information about the threat.
- Logs a Mail threat detected event.

Kaspersky Security for Windows Server scans emails when they are opened, not when they are received by the server. The scan is performed only once at a first opening. The scanned emails and attachments are stored in cache until the Outlook restart. After the restart all emails are scanned upon opening again.

► *The add-in is loaded to Microsoft Outlook mail client on startup. If you install Microsoft Outlook Add-in while the Outlook is running:*

1. Open the File > Options > Add-ins.
2. Make sure, that the Microsoft Outlook Add-in has been added to one of the lists (Active or Inactive).
3. Restart Microsoft Outlook.
4. Check the status of the Microsoft Outlook Add-in (must become Active).
## List of categories

Web resources are analyzed and categorized according to the tags. Tag can be applied to a number of categories (see table below).

*Table 51. Tags for web resource categories*

<table>
<thead>
<tr>
<th>Tag</th>
<th>Description</th>
<th>List of categories</th>
</tr>
</thead>
<tbody>
<tr>
<td>18+ (adult)</td>
<td>These categories may include web resources that potentially contain content for adults (18+), e.g. descriptions of violence, pornography, or obscene language.</td>
<td>Abortion, Adult dating, Anorexia, Discontent, Discrimination, Erotic, Illegal drugs, Illegal software, LGBT, Lingerie, Non-adult dating, Nudism, Policy decision, Porn, Restricted by global legislation, Restricted by RF legislation, Restricted by Roskomnadzor (RF), Sex education, Sex shops, Social networks, Suicide, Obscene vocabulary, Violence, Weapons.</td>
</tr>
<tr>
<td>children</td>
<td>These categories may include web resources that potentially contain content for children. For example, educational websites, children’s entertainment websites, forums and blogs about child-rearing.</td>
<td>For children, Restricted by Federal Law 436 (RF), Schools and universities pages.</td>
</tr>
<tr>
<td>drug</td>
<td>These categories may include web resources that potentially contain information about narcotics and other legal and illegal substances. For example, information about the distribution of prohibited drugs or alcohol, or the websites of registered pharmaceutical companies.</td>
<td>Abortion, Alcohol, Anorexia, Drugs, Health and beauty, Illegal drugs, Medicine, Pharmacy, Tobacco.</td>
</tr>
<tr>
<td>education</td>
<td>These categories may include web resources that potentially contain educational materials or materials about teaching. For example, online encyclopedias, knowledge bases, wikis, and the web pages of educational institutions or web pages about sex education.</td>
<td>Books and writing, Education, For children, Information technologies, Online encyclopedias, Schools and universities pages, Search engines, Sex education.</td>

**Predefined protection level settings**

One of three predefined protection levels for a node selected in the server file resources tree can be applied: Maximum performance, Recommended, and Maximum protection. Each of these levels contains its own predefined set of security settings (see the table below).

**Maximum performance**

The **Maximum performance** security level is recommended if, beyond using Kaspersky Security for Windows Server on servers and work stations, there are additional server security measures inside your network, for example, firewalls and existing security policies.

**Recommended**

The **Recommended** security level ensures an optimum combination of protection and performance impact on protected servers. This level is recommended by Kaspersky Lab experts as sufficient to protect servers on most corporate networks. The **Recommended** security level is set by default.

**Maximum protection**

The **Maximum protection** security level is recommended if your organization’s network has elevated computer security requirements.

<table>
<thead>
<tr>
<th>Opening policy settings for the Traffic Security task</th>
<th>Opening the Traffic Security rules list</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Opening policy settings for the Traffic Security task

To open the Applications Launch Control task settings via the Kaspersky Security Center policy:

1. Expand the Managed devices node in the Kaspersky Security Center Administration Console tree.
2. Select the administration group for which you want to configure the task.
3. Select the Policies tab.
4. Double-click the policy name you want to configure.
   In the Properties: <Policy name> window that opens, select the Real-time server protection section.
5. Click the Settings button in the Traffic Security subsection.
   The Traffic Security window opens.
6. Configure the policy as required.
Opening the Traffic Security rules list

To open the Applications Launch Control rules list via the Kaspersky Security Center:

1. Expand the Managed devices node in the Kaspersky Security Center Administration Console tree.
2. Select the administration group for which you want to configure the task.
3. Select the Policies tab.
4. Double-click the policy name you want to configure.
5. In the Properties: <Policy name> window that opens, select the Real-time server protection section.

The Web Control rules window opens.
Configure the rules list as required.

Configuring the Traffic Security task

To configure the Traffic Security task:

1. Open the Traffic Security window (see Section "Opening policy settings for the Traffic Security task" on page 303).
2. On the Task mode tab select and configure the task operation mode (see Section "Configuring the task operation mode" on page 305).
3. On the URL and web processing tab, configure the anti-phishing and anti-virus scanning of URLs (see Section "Configuring URL and web processing" on page 312).
4. On the Malware protection tab, configure the heuristic analyzer and security level (see Section "Configuring protection against web-based malware" on page 309).
5. On the Task management tab, configure the task start parameters based on a schedule (see Section "Managing task schedules" on page 134).
6. Click OK.

The task configuration is saved.
Configuring the task operation mode

To configure the task operation mode:

1. Open the Traffic Security window (see Section "Opening policy settings for the Traffic Security task" on page 303).

2. On the General tab, select one of the available modes from the Task mode drop-down list:
   - Driver Interceptor (see Section "Configuring the Driver Interceptor mode" on page 305)
   - Redirector (see Section "Configuring the Redirector mode" on page 307)
   - External Proxy

3. Specify the ICAP service connection settings (required for all three modes):
   - Network port number
     The port number of the ICAP service for Kaspersky Security for Windows Server.
   - Service ID
     An ID that makes part of the RESPMOD URI parameter of ICAP (see document RFC 3507). RESPMOD URI designates the address of an anti-virus ICAP server installed for the network storage area.
     For example, if the IP address of the protected server is 192.168.10.10, the port number is 1345, and the ICAP service ID is webscan, the corresponding RESPMOD URI address is icap://192.168.10.10/webscan:1345

   Restart the task to apply ICAP service connection settings.

4. Configure the selected task mode.

   No additional configuration is required for the External Proxy mode. Configuration is performed on the external proxy server.

5. Click OK.
   The configuration is saved.

Configuring the Driver Interceptor mode

To configure the Driver Interceptor mode:

1. Open the Traffic Security window (see Section "Opening policy settings for the Traffic Security task" on page 303).

2. On the General tab, select the Driver Interceptor task mode.

3. In the Task mode settings block, configure the following settings:
   - Check safe connections through the HTTPS protocol.
     If the check box is selected, intercepted encrypted HTTPS traffic is decompressed and scanned for threats.
If the check box is cleared, the encrypted HTTPS traffic is not decompressed. The check box is selected by default.

Scanning is available only if the HTTPS port is open.

- Select the version of a cryptographic protocol that you want to use:
  - TLS 1.0
  - TLS 1.1
  - TLS 1.2

  All versions are selected by default. At that, the **TLS 1.0** option cannot be disabled.

- Do not trust web-servers with invalid certificate.
  The check box can be selected if the **Check safe connections through the HTTPS protocol** check box is selected.
  If this check box is selected a web page with invalid certificate is blocked (certificate has expired, signature verification error, certificate is withdrawn, etc.)

- Security port.
  Specify the port number which is used to redirect traffic from the browser or network driver to inner port created by Kaspersky Security for Windows Server to detect web-based threats. It is not recommended to modify the default port. The port number must not coincide with any ports that are open for the ICAP service. If you use the **Redirector** task mode, ports that are already being used are listed in the **Check safe connections through the HTTPS protocol** field.

4. To add or exclude ports from the interception area, click the **Configure interception area** button. The **Interception area** window opens.

5. Select one of the following options on the **Intercept ports** tab:
   - **Intercept all**
   - **Intercept specified ports**:
     a. Enter the port number in the text field. You can add several ports by using a semicolon delimiter between port numbers.
     b. Click **Add**.
     Port is included in the interception area.

By default Kaspersky Security for Windows Server intercepts traffic that is transferred via the following ports: 80, 8080, 3128, 443.
6. To specify ports you want to exclude from the interception area on the **Exclude ports** tab:
   a. Enter the port number in the text field. You can add several ports by using a semicolon delimiter between port numbers.
   b. Click **Add**.
      Port is excluded from the area.

   By default Kaspersky Security for Windows Server excludes ports which are used by other applications and might cause issues when attempting to read data transferred via encrypted connection: 3389, 1723, 13291.

7. To exclude IP addresses from the interception area on the **Exclude IP addresses** tab:
   a. Enter IP addresses in IPv4 format (in a short form or specifying an address with a subnet mask).
   b. Click **Add**.
   c. Click **OK** to save the changes.

8. To exclude process or executable file which requires traffic exchange on the **Exclude processes** tab:
   a. Select the **Apply exclusions for processes** check box.
   b. To exclude a file:
      1. Click the **Executable files** button.
         The standard **Open** windows is displayed.
      2. Select the executable file you want to exclude and click **Open**.

9. In the **Interception area** window click the **OK** button.
10. In the **Traffic Security** window click the **OK** button.
    The task mode configuration is saved.

**Configuring the Redirector mode**

To configure the Redirector mode:

1. Open the **Traffic Security** window (see Section "Opening policy settings for the Traffic Security task" on page 303).
2. On the **General** tab, select the **Redirector** task mode.
3. In the **Task mode settings** block, configure the following settings:
   - **Check safe connections through the HTTPS protocol**.
     If the check box is selected, intercepted encrypted HTTPS traffic is decompressed and scanned for threats.
     If the check box is cleared, the encrypted HTTPS traffic is not decompressed.
     The check box is selected by default.

Scanning is available only if the HTTPS port is open.
• Select the version of a cryptographic protocol that you want to use:
  • TLS 1.0
  • TLS 1.1
  • TLS 1.2

  All versions are selected by default. At that, the TLS 1.0 option cannot be disabled.

• Redirect traffic to proxy server after scanning.
  If the check box is selected, Kaspersky Security for Windows Server redirects traffic that
  has already been scanned to an external proxy, for example, a corporate proxy server
  that is used within the corporate network.
  
  If the check box is cleared, traffic is sent directly to an internal proxy.

• Proxy server address.
  The address of the internal terminal proxy server used for redirection. Enter the address
  in IPv4 format.

• Port.
  The port number for the internal proxy.

• Security port.
  Specify the port number which is used to redirect traffic from the browser or network
  driver to inner port created by Kaspersky Security for Windows Server to detect web-
  based threats. It is not recommended to modify the default port. The port number must
  not coincide with any ports that are open for the ICAP service. If you use the Redirector
  task mode, ports that are already being used are listed in the Check safe connections
  through the HTTPS protocol field.

  For the Redirector mode, the operating system must be configured to transfer encrypted traffic via
  the port specified by Kaspersky Security for Windows Server.

4. Click OK.

The task mode configuration is saved.
Configuring protection against web-based malware

The following protection settings affect all incoming traffic. However, the selected actions on infected and other detected objects are performed only for mail attachments.

► To configure heuristic analysis to detect viruses and other computer security threats that are transferred via web traffic:

1. Open the Traffic Security window (see Section "Opening policy settings for the Traffic Security task" on page 303).

2. On the Malware protection tab:
   - Select the Use heuristic analyzer check box.
   - Set the required level of heuristic analysis for malware scanning. 
   - Select the security level (see Section "Predefined protection level settings" on page 300) from the dropdown list:
     - Recommended
     - Maximum protection
     - Maximum performance
     - Custom

3. Open the General tab by clicking Settings and in the Object protection section, specify the objects that you want to include in the scan scope:
   - All objects
     Kaspersky Security for Windows Server scans all objects.
   - Objects scanned by format
     Kaspersky Security for Windows Server scans only infectable objects based on file format. 
     Kaspersky Lab compiles the list of formats. It is included in the Kaspersky Security for Windows Server databases.
   - Objects scanned according to list of extensions specified in anti-virus database
     Kaspersky Security for Windows Server scans only infectable objects based on file extension. 
     Kaspersky Lab compiles the list of extensions. It is included in the Kaspersky Security for Windows Server databases.
   - Objects scanned by specified list of extensions
     Kaspersky Security for Windows Server scans files based on file extension. List of file extensions can be manually customized in the List of extensions window, which can be opened by clicking the Edit button.
     a. Click the Modify button to edit list of extensions.
b. In the widow that opens, specify an extension.

c. Click Add.

4. In the **Compound object protection** section, specify the compound objects that you want to include in the scan scope:

   - **Archives**
     
     Scanning of ZIP, CAB, RAR, ARJ archives and other archive formats.
     
     - If this check box is selected, Kaspersky Security for Windows Server scans archives.
     
     - If this check box is cleared, Kaspersky Security for Windows Server skips archives during scanning.
     
     The default value depends on the selected protection level.

   - **SFX archives**
     
     Scanning of self-extracting archives.
     
     - If this check box is selected, Kaspersky Security for Windows Server scans SFX archives.
     
     - If this check box is cleared, Kaspersky Security for Windows Server skips SFX archives during scanning.
     
     The default value depends on the selected protection level.
     
     This option is active when the **Archives** check box is cleared.

   - **Packed objects**
     
     Scanning of executable files packed by binary code packers, such as UPX or ASPack.
     
     - If this check box is selected, Kaspersky Security for Windows Server scans executable files packed by packers.
     
     - If this check box is cleared, Kaspersky Security for Windows Server skips executable files packed by packers during scanning.
     
     The default value depends on the selected protection level.

   - **Embedded OLE objects**
     
     Scanning of objects embedded into files (such as Microsoft Word macros, or email message attachments).
     
     - If this check box is selected, Kaspersky Security for Windows Server scans objects embedded into files.
     
     - If this check box is cleared, Kaspersky Security for Windows Server skips objects embedded into files during scanning.
     
     The default value depends on the selected protection level.

5. On the **Actions** tab, select an action to be performed on infected and other detected objects:

   - **Block**
     
     Kaspersky Security for Windows Server blocks loading of a web page if malicious content is detected. The reason for blocking the requested web page is displayed instead of the web page.
Kaspersky Security for Windows Server permanently deletes infected attachments from email messages. At that, events about the discovered threats are registered in the Traffic Security task log.

- **Allow**

Kaspersky Security for Windows Server does not block the requested web page, but logs the event about the detection of malicious content.

Kaspersky Security for Windows Server does not delete infected attachments from email messages. At that, events about the discovered threats are registered in the Traffic Security task log.

6. **On the Performance tab,** configure the following settings:

- In the **Exclusions** section select or clear the **Do not detect** check box. To configure the list of objects to exclude:

  Objects are excluded from scanning by the name or name mask of the detectable object.

  The list of names of detectable objects is available on the Virus Encyclopedia https://encyclopedia.kaspersky.com/knowledge/classification/ website.

  If this check box is selected, Kaspersky Security for Windows Server skips specified detectable objects during scanning.

  If the check box is cleared, Kaspersky Security for Windows Server detects all objects specified in the application by default.

  The check box is cleared by default.

  a. Click the **Edit** button.

  b. In the widow that opens, specify object name or mask.

  c. Click **Add**.

- In the **Advanced settings** section, restrict the scanning time interval and object size:

  - **Stop scanning if it takes longer than (sec.)**
    
    Limits the duration of object scanning. The default value is 60 seconds.

    If the check box is cleared, scan duration is limited to the specified value.

    If the check box is cleared, scan duration is unlimited.

    By default, the check box is selected for the **Maximum performance** security level.

  - **Do not scan objects larger than (MB)**

    Excludes objects larger than the specified size from the scanning.

    Kaspersky Security for Windows Server skips objects whose size exceeds the specified limit during virus scan.

    By default, the value is set to 20 MB.

7. **Click OK** in the **Malware protection settings** window.

The security level configuration is saved.
Configuring mail threat protection

To use mail threat protection, the Microsoft Outlook Add-in must be installed and the protected server configured correctly (see Section “Mail threat protection” on page 296).

To enable mail threat protection:

2. On the Mail threat protection tab, select the Enable mail threat protection check box.
   - If this check box is selected, Kaspersky Security for Windows Server performs anti-virus and anti-phishing scanning of all incoming mail via the Kaspersky Security Microsoft Outlook Add-in.
   - If this check box is cleared, mail is not scanned.
   - The check box is selected by default.

   If you enable or disable mail threat protection the changes are applied after a short timeout (5 minutes) or immediately after Microsoft Outlook restart.

3. Click OK.
   The changes are saved.

Configuring URL and web processing

To check web resources for phishing threats and identify web addresses designated as malicious according to the anti-virus database and URL reputation from KSN:

2. On the General tab select and configure the task operation mode (see Section ”Configuring the task operation mode” on page 305).
3. On the URL and web processing tab:
   - Clear or select the Use malicious URL database to scan web links check box.
     - If the check box is selected, Kaspersky Security for Windows Server performs signature analysis on each URL.
     - If the check box is cleared, the anti-virus database is not used to scan URLs.
     - The check box is selected by default.
   - Clear or select the Use anti-phishing database to scan web pages check box.
     - If the check box is selected, Kaspersky Security for Windows Server checks each URL against the anti-phishing database. Anti-phishing scanning is based on heuristic analysis.
If the check box is cleared, Kaspersky Security for Windows Server does not detect phishing attacks.

The check box is selected by default.

Note that when you configure anti-phishing scanning of URLs, anti-phishing is automatically applied to emails.

• Clear or select the **Use Trusted Zone** check box.
  
  This check box enables / disables use of the Trusted Zone for a task.
  
  If the check box is selected, Kaspersky Security for Windows Server adds file operations of trusted processes to the scan exclusions configured in the task settings.
  
  If the check box is cleared, Kaspersky Security for Windows Server disregards the file operations of trusted processes when forming the protection scope for the task.
  
  The check box is selected by default.

• Clear or select the **Use KSN for protection** check box.
  
  This check box enables or disables the use of KSN services.
  
  If the check box is selected, the application uses Kaspersky Security Network data to ensure that the application responds more quickly to new threats and to reduce the likelihood of false positives.
  
  If the check box is cleared, the task does not use KSN services.
  
  The check box is selected by default.

The KSN reputation for URL is available only if all of the following conditions are met:

• The **Use KSN for protection** check box is selected in Traffic Security settings.

• The KSN Statement is accepted.

• The **Send data about the requested URLs** (see Section “Configuring the KSN Usage task via the Administration Plug-in” on page 283) check box is selected.

• The KSN Usage task is started.

4. **Click OK.**

The URL and web processing configuration is saved.

**Configuring Web control**

Configure the rules usage, manage the settings of certificates scanning and category-based web control.

**In this section**

<table>
<thead>
<tr>
<th>Configuring certificate scanning</th>
<th>314</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configuring category-based web control</td>
<td>315</td>
</tr>
<tr>
<td>Adding URL-based rules</td>
<td>317</td>
</tr>
</tbody>
</table>
Configuring certificate scanning

Kaspersky Security for Windows Server lets you scan and block web resources with invalid and expired certificates. In order to configure the scanning of certificates, the following steps must be performed:

a. Configure the Traffic Security task (see Section “Selecting and configuring the task mode” on page 314).

b. Add and apply Rules for certificates (see Section “Adding rules for certificates” on page 315).

The rules for certificates can only be used in Driver Interceptor or Redirector mode. By default, Kaspersky Security for Windows Server creates only denying rules for certificates.

Selecting and configuring the task mode

► To select and configure the mode for working with certificates:

2. On the General tab, select a mode that supports certificate scanning from the Task mode drop-down list:
   - Driver Interceptor (see Section “Configuring the Driver Interceptor mode” on page 305)
   - Redirector (see Section “Configuring the Redirector mode” on page 307)

3. In the Task mode settings block, configure the following settings:
   - Check safe connections through the HTTPS protocol.
     If the check box is selected, intercepted encrypted HTTPS traffic is decompressed and scanned for threats.
     If the check box is cleared, the encrypted HTTPS traffic is not decompressed.
     The check box is selected by default.

Scanning is available only if the HTTPS port is open.

- Select the version of a cryptographic protocol that you want to use:
  - TLS 1.0
  - TLS 1.1
  - TLS 1.2

All versions are selected by default. At that, the TLS 1.0 option cannot be disabled.

4. Click OK.

The task configuration is saved.
Adding rules for certificates

Rules for certificates can only be used in Driver Interceptor or Redirector mode. By default, Kaspersky Security for Windows Server creates only denying rules for certificates.

**To add or configure a certificate rule:**

1. Open the Web Control rules window (see Section "Opening the Traffic Security rules list" on page 304).
2. On the Web Control tab, select the Apply URL-based rules check box to apply rules.
   - If the check box is selected, Kaspersky Security for Windows Server blocks HTTPS certificates by applying custom denying rules for certificates.
   - If the check box is cleared, certificates are not scanned by the application.
3. Click the Add button to add a new rule.
4. In the context menu of the Add button select the Certificate-based rule option.
5. In the Certificate-based rule window that opens:
   a. Enter the name of the rule.
   b. Select the Apply rule check box.
   c. Select the Operator type: Use mask symbols or Use regular expressions.
   d. Specify the mask or expression in the Operator field.
   e. Click OK.
6. To edit a rule, select one rule in the list and click Modify.
7. Click the Save button in the Web Control rules window.
   The new rules are applied.

Configuring category-based web control

**To add or modify a traffic security category-based rule:**

1. Open the Web Control rules (see Section "Opening the Traffic Security rules list" on page 304) window.
2. Open the Categorization tab.
3. Select the Apply rules for web traffic category control check box.
   - If the check box is selected, Kaspersky Security for Windows Server categorizes and blocks web resources, that fall under the selected categories.
   - If the check box is cleared, Kaspersky Security for Windows Server does not perform categorization.
   - The check box is cleared by default.
   Category control settings become available.
4. Select or clear the following check boxes:
   - Allow access if the web page can not be categorized.
   - Allow access to legitimate web resources that can be used to damage your server.
   - Allow access to legitimate advertisement.

5. In the list of available categories (see Section "List of categories" on page 297):
   - Select the corresponding check box to allow a category. The Type of rule column changes to Allowing.
   - Clear the corresponding check box to block a category. The Type of rule column changes to Denying.

   The list of categories is predefined and cannot be modified (you cannot add or remove categories).

6. Click OK.
   The rules configuration is saved.

Using the not-a-virus mask

To use the not-a-virus mask for category analysis:

1. In the Kaspersky Security Center Administration Console, open the KSN Usage task settings (see Section "Configuring the KSN Usage task via the Administration Plug-in" on page 283).
2. Select the Send data about the requested URLs check box.
3. Start the KSN Usage task.
4. In the Traffic Security settings (see Section "Configuring the Traffic Security task" on page 304) window, select the Use KSN for protection check box.
5. In the Web Control rules window, on the Categorization tab, select the Apply rules for web traffic category control check box.
6. In the list of categories, select the categories for which you want to apply the not-a-virus mask.
   Objects from the selected categories, that correspond to the mask, will not be detected by the Traffic Security task.

The not-a-virus mask usage is configured in the Trusted Zone (see Section "Applying the not-a-virus mask" on page 499) settings.
Adding URL-based rules

You can add a URL-based rule to deny or allow a specific URL. These rules have higher priority than any other conclusions.

► To create a new URL-based rule:

1. Open the Web Control rules window (see Section "Opening the Traffic Security rules list" on page 304).
2. On the Web Control tab, select the Apply URL-based rules check box to apply rules.
   - If the check box is selected, Kaspersky Security for Windows Server blocks HTTPS certificates by applying custom denying rules for certificates.
   - If the check box is cleared, certificates are not scanned by the application.
   - The check box is selected by default.
3. Click the Add button to add a new rule.
4. In the context menu of the Add button select the URL-based rule option.
5. In the URL-based rule window that opens:
   a. Enter the name of the rule.
   b. Select the Rule type of rule: Denying or Allowing.
   c. Select the Apply rule check box.
   d. Specify the URL in the URL field.
   e. Click OK.
6. To edit a rule, select one rule in the list and click Modify.
7. Click OK in the Web Control rules window.
   The new rules are applied.

Managing Traffic Security via the Application Console

In this section, learn how to navigate the Application Console interface and configure task settings on a local server.

In this section

| Navigation | Configuring the Traffic Security task | Configuring protection against web-based malware | Configuring mail threat protection | Configuring URL and web processing | Configuring Web control | 318 | 318 | 322 | 325 | 326 | 327 |
Navigation

Learn how to navigate to the required task settings via the interface.

In this section

- Opening the Traffic Security task settings ........................................................................... 318
- Opening the Traffic Security rules window ........................................................................... 318

Opening the Traffic Security task settings

To open the Traffic Security general task settings via the Application Console:

1. In the Application Console tree, expand the Real-Time Server Protection node.
2. Select the Traffic Security child node.
3. Click the Properties link in the details pane of the Traffic Security node.
   The Task settings window opens.

Opening the Traffic Security rules window

To open the Traffic Security rule list via the Application Console:

1. In the Application Console tree, expand the Real-Time Server Protection node.
2. Select the Traffic Security child node.
3. Click the Web Control rules link in the details pane of the Traffic Security node.
   The Web Control rules window opens.
Configure the rules list as required.

Configuring the Traffic Security task

To configure the Traffic Security task:

1. Open the Task settings (see Section "Opening the Traffic Security task settings" on page 318) window.
2. On the General tab select and configure the task operation mode (see Section "Configuring the task operation mode" on page 319).
3. On the URL and web processing tab, configure the anti-phishing and anti-virus scanning of URLs (see Section "Configuring the Driver Interceptor mode" on page 319).
4. On the Malware protection tab, configure the heuristic analyzer and security level (see Section "Configuring protection against web-based malware" on page 322).
5. On the Schedule and Advanced tabs, start the task based on a schedule (see Section "Managing task schedules" on page 134).
6. Click OK to save changes.
Configuring the task operation mode

To configure the task operation mode:

1. Open the Task settings (see Section "Opening the Traffic Security task settings" on page 318) window.
2. On the General tab, select one of the available modes from the Task mode drop-down list:
   - Driver Interceptor
   - Redirector
   - External Proxy
3. Specify the ICAP service connection settings (required for all three modes):
   - Network port number
     The port number of the ICAP service for Kaspersky Security for Windows Server.
   - Service ID
     An ID that makes part of the RESPMOD URI parameter of ICAP (see document RFC 3507). RESPMOD URI designates the address of an anti-virus ICAP server installed for the network storage area.
     For example, if the IP address of the protected server is 192.168.10.10, the port number is 1345, and the ICAP service ID is webscan, the corresponding RESPMOD URI address is icap://192.168.10.10/webscan:1345
     Restart the task to apply ICAP service connection settings.
4. Configure the selected task mode.
   No additional configuration is required for the External Proxy mode. Configuration is performed on the external proxy server.
5. Click OK.
The configuration is saved.

Configuring the Driver Interceptor mode

To configure the Driver Interceptor mode:

1. Open the Task settings (see Section "Opening the Traffic Security task settings" on page 318) window.
2. On the **General** tab select the **Driver Interceptor** task mode.

3. In the **Task mode settings** block, configure the following settings:
   - **Check safe connections through the HTTPS protocol.**
     - If the check box is selected, intercepted encrypted HTTPS traffic is decompressed and scanned for threats.
     - If the check box is cleared, the encrypted HTTPS traffic is not decompressed.
     - The check box is selected by default.

   Scanning is available only if the HTTPS port is open.

   - **Select the version of a cryptographic protocol that you want to use:**
     - TLS 1.0
     - TLS 1.1
     - TLS 1.2
     - *All versions are selected by default. At that, the TLS 1.0 option cannot be disabled.*

   - **Do not trust web-servers with invalid certificate.**
     - The check box can be selected if the **Check safe connections through the HTTPS protocol** check box is selected.
     - If this check box is selected a web page with invalid certificate is blocked (certificate has expired, signature verification error, certificate is withdrawn, etc.)

   - **Security port.**
     - Specify the port number which is used to redirect traffic from the browser or network driver to inner port created by Kaspersky Security for Windows Server to detect web-based threats. It is not recommended to modify the default port. The port number must not coincide with any ports that are open for the ICAP service. If you use the **Redirector** task mode, ports that are already being used are listed in the **Check safe connections through the HTTPS protocol** field.

4. To add or exclude ports from the interception area, click the **Configure interception area** button. The **Interception area** window opens.

5. Select one of the following options on the **Intercept ports** tab:
   - **Intercept all**
   - **Intercept specified ports:**
     - a. Enter the port number in the text field. You can add several ports by using a semicolon delimiter between port numbers.
     - b. Click **Add**.
     - Port is included in the interception area.
By default Kaspersky Security for Windows Server intercepts traffic that is transferred via the following ports: 80, 8080, 3128, 443.

6. To specify ports you want to exclude from the interception area on the **Exclude ports** tab:
   a. Enter the port number in the text field. You can add several ports by using a semicolon delimiter between port numbers.
   b. Click **Add**.
      
      Port is excluded from the area.

By default Kaspersky Security for Windows Server excludes ports which are used by other applications and might cause issues when attempting to read data transferred via encrypted connection: 3389, 1723, 13291.

7. To exclude IP addresses from the interception area on the **Exclude IP addresses** tab:
   a. Enter IP addresses in IPv4 format (in a short form or specifying an address with a subnet mask).
   b. Click **Add**.
   c. Click **OK** to save the changes.

8. To exclude process or executable file which requires traffic exchange on the **Exclude processes** tab:
   a. Select the **Apply exclusions for processes** check box.
   b. To exclude a file:
      1. Click the **Executable files** button.
         
         The standard **Open** windows is displayed.
      2. Select the executable file you want to exclude and click **Open**.

9. In the **Interception area** window click the **OK** button.

10. In the **Task settings** window click the **OK** button.
    The task mode configuration is saved.

### Configuring the Redirector mode

**To configure the Redirector mode:**

1. Open the **Task settings** (see Section "Opening the Traffic Security task settings" on page 318) window.
2. On the **General** tab select the **Redirector** task mode.
3. In the **Task mode settings** block, configure the following settings:
   - **Check safe connections through the HTTPS protocol.**
     
     If the check box is selected, intercepted encrypted HTTPS traffic is decompressed and scanned for threats.
     If the check box is cleared, the encrypted HTTPS traffic is not decompressed.
     The check box is selected by default.
Scanning is available only if the HTTPS port is open.

- Select the version of a cryptographic protocol that you want to use:
  - TLS 1.0
  - TLS 1.1
  - TLS 1.2

All versions are selected by default. At that, the TLS 1.0 option cannot be disabled.

- Security port.
  Specify the port number which is used to redirect traffic from the browser or network driver to inner port created by Kaspersky Security for Windows Server to detect web-based threats. It is not recommended to modify the default port. The port number must not coincide with any ports that are open for the ICAP service. If you use the Redirector task mode, ports that are already being used are listed in the Check safe connections through the HTTPS protocol field.

- Redirect traffic to an external proxy after checking.
  If the check box is selected, Kaspersky Security for Windows Server redirects traffic that has already been scanned to an external proxy, for example, a corporate proxy server that is used within the corporate network.
  If the check box is cleared, traffic is sent directly to an internal proxy.

- Proxy server address.
  The address of the internal terminal proxy server used for redirection. Enter the address in IPv4 format.

- Port.
  The port number for the internal proxy.

For the Redirector mode, the operating system must be configured to transfer encrypted traffic via the port specified by Kaspersky Security for Windows Server.

4. Click OK.

The task mode configuration is saved.

**Configuring protection against web-based malware**

The following protection settings affect all incoming traffic. However, the selected actions on infected and other detected objects are performed only for mail attachments.
To configure heuristic analysis to detect viruses and other computer security threats that are transferred via web traffic:

1. Open the **Task settings** (see Section "Opening the Traffic Security task settings" on page 318) window.

2. On the **Malware protection** tab:
   - Select the **Use heuristic analyzer** check box.
   - Set the required level of heuristic analysis for malware scanning.
   - Select the protection level (see Section "Predefined protection level settings" on page 300) from the drop-down list:
     - Recommended
     - Maximum protection
     - Maximum performance
     - Custom

3. On the **Description** tab below you can review the settings of the selected protection level.

4. Open the **General** tab and in the **Objects protection** section, specify the objects that you want to include in the scan scope:
   - **All objects**
     Kaspersky Security for Windows Server scans all objects.
   - **Objects scanned by format**
     Kaspersky Security for Windows Server scans only infectable objects based on file format.
     Kaspersky Lab compiles the list of formats. It is included in the Kaspersky Security for Windows Server databases.
   - **Objects scanned according to list of extensions specified in anti-virus database**
     Kaspersky Security for Windows Server scans only infectable objects based on file extension.
     Kaspersky Lab compiles the list of extensions. It is included in the Kaspersky Security for Windows Server databases.
   - **Objects scanned by specified list of extensions**
     Kaspersky Security for Windows Server scans files based on file extension. List of file extensions can be manually customized in the **List of extensions** window, which can be opened by clicking the **Edit** button.
     a. Click the **Modify** button to edit list of extensions.
     b. In the widow that opens, specify an extension.
     c. Click **Add**.

Click the **By default** button to populate the list with the preset list of excluded extensions.

5. In the **Compound objects protection** section, specify the compound objects that you want to include in the scan scope:
- **Archives**
  Scanning of ZIP, CAB, RAR, ARJ archives and other archive formats.
  If this check box is selected, Kaspersky Security for Windows Server scans archives.
  If this check box is cleared, Kaspersky Security for Windows Server skips archives during scanning.
  The default value depends on the selected protection level.

- **SFX archives**
  Scanning of self-extracting archives.
  If this check box is selected, Kaspersky Security for Windows Server scans SFX archives.
  If this check box is cleared, Kaspersky Security for Windows Server skips SFX archives during scanning.
  The default value depends on the selected protection level.
  This option is active when the Archives check box is cleared.

- **Packed objects**
  Scanning of executable files packed by binary code packers, such as UPX or ASPack.
  If this check box is selected, Kaspersky Security for Windows Server scans executable files packed by packers.
  If this check box is cleared, Kaspersky Security for Windows Server skips executable files packed by packers during scanning.
  The default value depends on the selected protection level.

- **Embedded OLE objects**
  Scanning of objects embedded into files (such as Microsoft Word macros, or email message attachments).
  If this check box is selected, Kaspersky Security for Windows Server scans objects embedded into files.
  If this check box is cleared, Kaspersky Security for Windows Server skips objects embedded into files during scanning.
  The default value depends on the selected protection level.

6. **On the Actions tab**, select an action to be performed on infected and other detected objects:

   - **Block**
     Kaspersky Security for Windows Server blocks loading of a web page if malicious content is detected. The reason for blocking the requested web page is displayed instead of the web page.
     Kaspersky Security for Windows Server permanently deletes infected attachments from email messages. At that, events about the discovered threats are registered in the Traffic Security task log.

   - **Allow**
     Kaspersky Security for Windows Server does not block the requested web page, but logs the event about the detection of malicious content.
     Kaspersky Security for Windows Server does not delete infected attachments from email...
messages. At that, events about the discovered threats are registered in the Traffic Security task log.

7. On the **Performance** tab, configure the following settings:
   - In the **Exclusions** section select or clear the **Do not detect** check box. To configure the list of objects to exclude:
     - Objects are excluded from scanning by the name or name mask of the detectable object. The list of names of detectable objects is available on the Virus Encyclopedia [https://encyclopedia.kaspersky.com/knowledge/classification/](https://encyclopedia.kaspersky.com/knowledge/classification/) website.
     - If this check box is selected, Kaspersky Security for Windows Server skips specified detectable objects during scanning.
     - If the check box is cleared, Kaspersky Security for Windows Server detects all objects specified in the application by default.
     - The check box is cleared by default.
       a. Click the **Modify** button.
       b. In the widow that opens, specify object name or mask.
       c. Click **Add**.
   - In the **Advanced settings** section, restrict the scanning time interval and object size:
     - **Stop scanning if it takes longer than (sec.)**
       - Limits the duration of object scanning. The default value is 60 seconds.
       - If the check box is cleared, scan duration is limited to the specified value.
       - If the check box is cleared, scan duration is unlimited.
       - By default, the check box is selected for the **Maximum performance** security level.
     - **Do not scan objects larger than (MB)**
       - Excludes objects larger than the specified size from the scanning.
       - Kaspersky Security for Windows Server skips objects whose size exceeds the specified limit during virus scan.
       - By default, the value is set to 20 MB.

1. Click **OK** in the **Task settings** window.
   The protection level configuration is saved.

### Configuring mail threat protection

> **To enable mail threat protection:**

1. Open the **Task settings** (see Section "Opening the Traffic Security task settings" on page 318) window.
2. On the **Mail threat protection** tab, select the **Enable mail threat protection** check box.
   - If this check box is selected, Kaspersky Security for Windows Server performs anti-virus and anti-phishing scanning of all incoming mail via the Kaspersky Security Microsoft Outlook Add-in.
   - If this check box is cleared, mail is not scanned.
   - The check box is selected by default.
Traffic Security

3. Click OK.
The changes are saved.

Configuring URL and web processing

To check web resources for phishing threats and identify web addresses designated as malicious according to the anti-virus database and URL reputation from KSN:

1. Open the Task settings (see Section "Opening the Traffic Security task settings" on page 318) window.
2. On the Task mode section of the General tab, select and configure the task operation mode (see Section "Configuring the task operation mode" on page 319).
3. On the URL and web processing tab:
   - Clear or select the Use malicious URL database to scan web links check box.
     If the check box is selected, Kaspersky Security for Windows Server performs signature analysis on each URL.
     If the check box is cleared, the anti-virus database is not used to scan URLs.
     The check box is selected by default.
   - Clear or select the Use anti-phishing database to scan web pages check box.
     If the check box is selected, Kaspersky Security for Windows Server checks each URL against the anti-phishing database. Anti-phishing scanning is based on heuristic analysis.
     If the check box is cleared, Kaspersky Security for Windows Server does not detect phishing attacks.
     The check box is selected by default.
     Note that when you configure anti-phishing scanning of URLs, anti-phishing is automatically applied to emails.
   - Clear or select the Use Trusted Zone check box.
     This check box enables / disables use of the Trusted Zone for a task.
     If the check box is selected, Kaspersky Security for Windows Server adds file operations of trusted processes to the scan exclusions configured in the task settings.
     If the check box is cleared, Kaspersky Security for Windows Server disregards the file operations of trusted processes when forming the protection scope for the task.
     The check box is selected by default.
   - Clear or select the Use KSN for protection check box.
     This check box enables or disables the use of KSN services.
     If the check box is selected, the application uses Kaspersky Security Network data to ensure that the application responds more quickly to new threats and to reduce the likelihood of false positives.
If the check box is cleared, the task does not use KSN services.
The check box is selected by default.

The KSN reputation for URL is available only if all of the following conditions are met:

- The **Use KSN for protection** check box is selected in Traffic Security settings.
- The KSN Statement is accepted.
- The **Send data about scanned URLs** (see Section "Configuring KSN Usage task via the Application Console" on page 288) check box is selected.
- The KSN Usage task is started.

4. Click **OK**.
The URL and web processing configuration is saved.

## Configuring Web control

Configure the rules usage, manage the settings of certificates scanning and category-based web control.

### In this section

<table>
<thead>
<tr>
<th>Configuring certificate scanning</th>
<th>327</th>
</tr>
</thead>
<tbody>
<tr>
<td>Configuring category-based web control</td>
<td>329</td>
</tr>
<tr>
<td>Adding URL-based rules</td>
<td>330</td>
</tr>
</tbody>
</table>

### Configuring certificate scanning

Kaspersky Security for Windows Server lets you scan and block web resources with invalid and expired certificates.
In order to configure the scanning of certificates, the following steps must be performed:

a. Configure the Traffic Security task (see Section "Selecting and configuring the task mode" on page 327).
b. Add and apply Rules for certificates (see Section "Adding rules for certificates" on page 328).

The rules for certificates can only be used in **Driver Interceptor** or **Redirector** mode. By default, Kaspersky Security for Windows Server creates only denying rules for certificates.

### Selecting and configuring the task mode

To select and configure the mode for working with certificates:

1. Open the **Task settings** (see Section "Opening the Traffic Security task settings" on page 318) window.
2. On the **General** tab, select a mode that supports certificate scanning from the **Task mode** drop-down list:
   - **Driver Interceptor** (see Section "Configuring the Driver Interceptor mode" on page 319)
   - **Redirector**
3. In the **Task mode settings** block, configure the following settings:

- **Check safe connections through the HTTPS protocol.**
  
  If the check box is selected, intercepted encrypted HTTPS traffic is decompressed and scanned for threats.

  If the check box is cleared, the encrypted HTTPS traffic is not decompressed.

  The check box is selected by default.

  *Scanning is available only if the HTTPS port is open.*

- Select the version of a cryptographic protocol that you want to use:
  - TLS 1.0
  - TLS 1.1
  - TLS 1.2

  *All versions are selected by default. At that, the TLS 1.0 option cannot be disabled.*

4. Click **OK**.

   The task configuration is saved.

---

**Adding rules for certificates**

Rules for certificates can only be used in **Driver Interceptor** or **Redirector** mode. By default, Kaspersky Security creates only denying rules for certificates.

*To add or configure a certificate rule:*

1. Open the **Web Control rules** window (see Section "Opening the Traffic Security rules window" on page 318).

2. On the **Web Control** tab, select the **Apply URL-based rules** check box to apply rules.

   If the check box is selected, Kaspersky Security for Windows Server blocks HTTPS certificates by applying custom denying rules for certificates.

   If the check box is cleared, certificates are not scanned by the application.

   The check box is selected by default.

3. Click the **Add** button to add a new rule.

4. In the context menu of the **Add** button select the **Certificate-based rule** option.

5. In the **Certificate-based rule** window that opens:
   a. Enter the name of the rule.
   b. Select the **Apply rule** check box.
   c. Select the **Operator type: Use mask symbols** or **Use regular expressions**.
d. Specify the mask or expression in the **Operator** field.
e. Click **OK**.

6. To edit a rule, select one rule in the list and click **Modify**.

7. Click the **Save** button in the **Web Control rules** window.
The new rules are applied.

### Configuring category-based web control

► **To add or modify a traffic security category-based rule:**

1. Open the **Web Control rules** (see Section "Opening the Traffic Security rules window" on page 318) window.
2. Open the **Categorization** tab.
3. Select the **Apply rules for web traffic category control** check box.
   - If the check box is selected, Kaspersky Security for Windows Server categorizes and blocks web resources, that fall under the selected categories.
   - If the check box is cleared, Kaspersky Security for Windows Server does not perform categorization.
      - The check box is cleared by default.

Category control settings become available.

4. Select or clear the following check boxes:
   - **Allow access if the web page can not be categorized**.
   - **Allow access to legitimate web resources that can be used to damage your server**.
   - **Allow access to legitimate advertisement**.

5. In the list of available categories (see Section "List of categories" on page 297):
   - Select the corresponding check box to allow a category.
      - The **Type** column changes to **Allowing**.
   - Clear the corresponding check box to block a category.
      - The **Type** column changes to **Denying**.

The list of categories is predefined and cannot be modified (you cannot add or remove categories).

6. Click **Save**.
The rules configuration is saved.
Using the not-a-virus mask

To use the not-a-virus mask for category analysis:

1. In the Application Console tree, open the KSN Usage task settings (see Section "Configuring KSN Usage task via the Application Console" on page 288).
2. Select the Send data about scanned URLs check box.
3. Start the KSN Usage task.
4. In the Traffic Security settings (see Section "Configuring the Driver Interceptor mode" on page 319) window, select the Use KSN for protection check box.
5. In the Web Control rules window, on the Categorization tab, select the Apply rules for web traffic category control check box.
6. In the list of categories, select the categories for which you want to apply the not-a-virus mask.

Objects from the selected categories, that correspond to the mask, will not be detected by the Traffic Security task.

The not-a-virus mask usage is configured in the Trusted Zone settings.

Adding URL-based rules

You can add a URL-based rule to deny or allow a specific URL. These rules have higher priority than any other conclusions.

To create a new URL-based rule:

1. Open the Web Control rules (see Section "Opening the Traffic Security rules window" on page 318) window.
2. On the Web Control tab, select the Apply URL-based rules check box to apply rules.
   - If the check box is selected, Kaspersky Security for Windows Server blocks HTTPS certificates by applying custom denying rules for certificates.
   - If the check box is cleared, certificates are not scanned by the application.
   - The check box is selected by default.
3. Click the Add button to add a new rule.
4. In the context menu of the Add button select the URL-based rule option.
5. In the URL-based rule window that opens:
   a. Enter the name of the rule.
   b. Select the Rule type of rule: Denying or Allowing.
   c. Select the Apply rule check box.
   d. Specify the URL in the URL field.
   e. Click OK.
6. To edit a rule, select one rule in the list and click **Modify**.
7. Click the **Save** button in the **Web Control rules** window.

The new rules are applied.
Anti-Cryptor

This section contains information about the Anti-Cryptor task and how to configure it.

In this chapter

- About the Anti-Cryptor task ................................................................. 332
- Anti-Cryptor task statistics .................................................................... 333
- Default Anti-Cryptor task settings ....................................................... 333
- Configuring Anti-Cryptor task via the Administration Plug-in .................. 334
- Configuring the Anti-Cryptor task via the Application Console ................. 338

About the Anti-Cryptor task

The Anti-Cryptor task makes it possible to detect malicious encrypting of the network file resources of a protected server from remote computers on the corporate network.

While the Anti-Cryptor task runs, Kaspersky Security for Windows Server scans remote computers' calls to access files located in the shared folders of the protected server. If the application considers a remote computer's actions on network file resources to be malicious encrypting, then Kaspersky Security for Windows Server adds the locally unique identifier (LUID) of the computer to the list of blocked hosts.

The Anti-Cryptor task can be performed in a synchronous or asynchronous mode. By default, the Anti-Cryptor task is working in the asynchronous mode, and the processing of file operations is distributed to several parallel streams. For more detailed information about the synchronous and asynchronous modes of processing of file operations and about changing the mode of processing of file operations, refer to Kaspersky Lab Knowledge Base (see Section "Sources for independent retrieval of information" on page 17).

Kaspersky Security for Windows Server does not consider activity to be malicious encrypting if the detected encryption activity takes place in folders excluded from the scope of the Anti-Cryptor task.

By default, the application blocks hosts' access to network file resources for 30 minutes.

The Anti-Cryptor task does not block access to network file resources until the host's activity is identified as malicious. This can take some time, during which the encryption program can conduct malicious activity.

If the Anti-Cryptor task runs in Statistics only mode, Kaspersky Security for Windows Server only logs remote computers' attempts at malicious encrypting in the task log.
Anti-Cryptor task statistics

If the Anti-Cryptor task is running, you can view real-time information about the number of objects processed by Kaspersky Security for Windows Server from when the task was started up until now, i.e., task execution statistics.

To view Anti-Cryptor task statistics:

1. In the Application Console tree, expand the **Real-Time Server Protection** node.
2. Select the **Anti-Cryptor** child node.

Task statistics are displayed in the **Statistics** section of the details pane of the selected node.

You can view information about objects processed by Kaspersky Security for Windows Server since the task was started (see the table below).

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Malicious encrypting attempts detected</td>
<td>The number of access attempts where Kaspersky Security for Windows Server detected encryption activity.</td>
</tr>
<tr>
<td>Processing errors</td>
<td>Number of application requests to the storage area that resulted in a task error.</td>
</tr>
<tr>
<td>Objects processed</td>
<td>Total number of access attempts processed by Kaspersky Security for Windows Server.</td>
</tr>
</tbody>
</table>

Default Anti-Cryptor task settings

The Anti-Cryptor task uses the default settings described in the table below. You can change the values of these settings.

<table>
<thead>
<tr>
<th>Setting</th>
<th>Default value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Work mode</strong></td>
<td>Active</td>
<td>The Anti-Cryptor task can be started in <strong>Active</strong> or <strong>Statistics only</strong> mode.</td>
</tr>
<tr>
<td><strong>Protection area</strong></td>
<td>Kaspersky Security for Windows Server applies the Anti-Cryptor task to all of the protected server's shared folders by default.</td>
<td>You can change the protection scope by specifying shared folders to which the task will apply.</td>

</tbody>
</table>
### Configuring Anti-Cryptor task via the Administration Plug-in

To configure Anti-Cryptor task settings take the following steps:

1. Expand the **Managed devices** node in the Kaspersky Security Center Administration Console tree.
2. Select the administration group for which you want to configure application settings.
3. Perform one of the following actions in the details pane of the selected administration group:
   - To configure application settings for a group of servers, select the **Policies** tab and open the *Properties: <Policy name>* window (see Section "Configuring policy" on page 119).
   - To configure the application for a single server, select the **Devices** tab and open the *Application settings* window (see Section "Configuring local tasks in the Application settings window of the Kaspersky Security Center" on page 124).

   If an active Kaspersky Security Center policy is applied to a device, and this policy blocks changes to application settings, then these settings cannot be edited in the *Application settings* window.

4. In the **Network activity control** section, click the **Settings** button in the **Anti-Cryptor** subsection.
   
The *Anti-Cryptor* window opens.

5. In the window that opens, configure the following settings:
   - Task mode and heuristic analyzer usage (see Section "General task settings" on page 335) on the **General** tab.
   - Protection scope (see Section "Creating protection scope" on page 336) on the **Protection scope** tab.
   - Exclusions (see Section "Adding exclusions" on page 337) on the **Exclusions** tab.
   - Scheduled task start settings (see Section "Managing task schedules" on page 134) on the **Task management** tab.

6. Click **OK**.

Kaspersky Security for Windows Server immediately applies the new settings to the running task. Information about the date and time, when the settings were modified, and the values of task settings before and after modification are saved in the task log.

---

General task settings .................................................................................................................................................. 335
Creating protection scope .............................................................................................................................................. 336
Adding exclusions ........................................................................................................................................................ 337

General task settings

To configure the general task settings:

1. Expand the Managed devices node in the Kaspersky Security Center Administration Console tree.
2. Select the administration group for which you want to configure application settings.
3. Perform one of the following actions in the details pane of the selected administration group:
   • To configure application settings for a group of servers, select the Policies tab and open the Properties: <Policy name> window (see Section "Configuring policy" on page 119).
   • To configure the application for a single server, select the Devices tab and open the Application settings window (see Section "Configuring local tasks in the Application settings window of the Kaspersky Security Center" on page 124).

If an active Kaspersky Security Center policy is applied to a device, and this policy blocks changes to application settings, then these settings cannot be edited in the Application settings window.

4. In the Network activity control section, click the Settings button in the Anti-Cryptor subsection.
   The Anti-Cryptor window opens.
5. In the Work mode section on the General tab, select the Active mode.
   If this mode is selected, Kaspersky Security for Windows Server blocks access to the shared folders for compromised computers, when the malicious encryption attempt is detected.
6. Clear or select the Use heuristic analyzer check box.
   This check box enables / disables Heuristic Analyzer during object scanning.
   If the check box is selected, Heuristic Analyzer is enabled.
   If the check box is cleared, Heuristic Analyzer is disabled.
   The check box is selected by default.
7. If necessary, adjust the level of analysis using the slider.
   The slider allows you to adjust the heuristic analysis level. The scanning intensity level sets the balance between the thoroughness of searches for threats, the load on the operating system’s resources and the time required for scanning.
The following scanning intensity levels are available:

- **Light.** Heuristic analyzer performs fewer operations found inside executable files. The probability of threat detection in this mode is somewhat lower. Scanning is faster and less resource-intensive.
- **Medium.** Heuristic Analyzer performs the number of instructions found within executable files recommended by the experts of Kaspersky Lab. This level is selected by default.
- **Deep.** Heuristic analyzer performs more operations found in executable files. The probability of threat detection in this mode is higher. The scan uses up more system resources, takes more time, and can cause a higher number of false alarms.

The slider is available if the **Use heuristic analyzer** check box is selected.

8. Click OK to apply new configuration.

**Creating protection scope**

The following types of protection scope are applied in the Anti-Cryptor task:

- **Predefined.** You can use the protection scope installed by default, which includes all shared server folders in the scan. Applied if the **All shared network folders on the server** setting is selected.
- **User.** You can manually configure the protection scope by selecting the folders that need to be included in the encryption protection scope. Applied if the **Only specified shared folders** setting is selected.

You can use only local path for configuring the protection scope for the Anti-Cryptor task.

**To configure a protection scope for the Anti-Cryptor task:**

1. Expand the **Managed devices** node in the Kaspersky Security Center Administration Console tree.
2. Select the administration group for which you want to configure application settings.
3. Perform one of the following actions in the details pane of the selected administration group:
   - To configure application settings for a group of servers, select the **Policies** tab and open the **Properties: <Policy name>** window (see Section "Configuring policy" on page 119).
   - To configure the application for a single server, select the **Devices** tab and open the **Application settings** window (see Section "Configuring local tasks in the Application settings window of the Kaspersky Security Center" on page 124).

If an active Kaspersky Security Center policy is applied to a device, and this policy blocks changes to application settings, then these settings cannot be edited in the **Application settings** window.

4. In the **Network activity control** section, click the **Settings** button in the **Anti-Cryptor** subsection.

The **Anti-Cryptor** window opens.
5. On the Protection scope tab, select the folders that Kaspersky Security for Windows Server will scan when executing the Anti-Cryptor task:

- **All shared network folders on the server.**
  
  If this option is selected, when the Anti-Cryptor task is executed, Kaspersky Security for Windows Server scans all of the server's shared folders.
  
  This option is selected by default.

- **Only specified shared folders.**
  
  If this option is selected, during execution of the Anti-Cryptor task Kaspersky Security for Windows Server protects only the shared server folders that you specified manually.

6. To specify the server’s shared folders, that you want to include in the encryption protection scope:

   a. Select **Only specified shared folders** and click the **Add** button.
      
      The **Select a folder to add** window opens.
   
   b. Click the **Browse** button to select a folder, or enter the folder manually.
   
   c. Click **OK**.

7. Click **OK** in the Anti-Cryptor window.

The specified settings are saved.

### Adding exclusions

► To add exclusions from the encryption protection scope take the following steps:

   1. Expand the Managed devices node in the Kaspersky Security Center Administration Console tree.
   
   2. Select the administration group for which you want to configure application settings.
   
   3. Perform one of the following actions in the details pane of the selected administration group:
      
      - To configure application settings for a group of servers, select the **Policies** tab and open the Properties: <Policy name> window (see Section "Configuring policy" on page 119).
      
      - To configure the application for a single server, select the **Devices** tab and open the Application settings window (see Section "Configuring local tasks in the Application settings window of the Kaspersky Security Center" on page 124).

     If an active Kaspersky Security Center policy is applied to a device, and this policy blocks changes to application settings, then these settings cannot be edited in the Application settings window.

   4. In the Network activity control section, click the **Settings** button in the Anti-Cryptor subsection.
      
      The Anti-Cryptor window opens.

   5. On the Exclusions tab, select the **Apply exclusion list** check box.
      
      If the check box is selected, Kaspersky Security for Windows Server does not detect malicious encryption activity that occur in the specified areas, when the Anti-Cryptor task is run.
If the check box is cleared, Kaspersky Security for Windows Server detects encryption activity in all shared folders.

By default, the check box is selected and the exclusion list includes following items added by the Kaspersky Lab experts:

- *.stt;
- *.sig;
- *.exe;
- *.sldprt.

6. Click the Add button.

   The Select a folder to add window opens.

7. Click the Browse button to select a folder, or enter the folder manually.

8. Click OK.

   Excluded area will be added to the list.

Configuring the Anti-Cryptor task via the Application Console

To configure Anti-Cryptor task settings take the following steps:

1. In the Application Console tree, expand the Real-Time Server Protection node.

2. Select the Anti-Cryptor child node.

3. Click the Properties link in the details pane of the Anti-Cryptor node.

   The Task settings window opens.

4. In the window that opens, configure the following settings:

   - Work mode and heuristic analyzer usage (see Section "General task settings" on page 340) on the General tab.
   - Protection area (see Section "Creating protection scope" on page 339) on the Protection area tab.
   - Exclusions (see Section "Adding exclusions" on page 341) on the Exclusions tab.
   - Scheduled task start settings (see Section "Managing task schedules" on page 134) on the Schedule and Advanced tabs.

5. Click OK.

   Kaspersky Security for Windows Server immediately applies the new settings to the running task.

   Information about the date and time, when the settings were modified, and the values of task settings before and after modification are saved in the task log.
Creating protection scope

The following types of protection scope are applied in the Anti-Cryptor task:

- **Predefined.** You can use the protection scope installed by default which includes all shared server network folders in the scan. Applied if the **All shared network folders on the server** setting is selected.

- **User.** You can manually configure the protection scope by selecting the folders that need to be included in the encryption protection scope. Applied if the **Only specified shared folders** setting is selected.

You can use only local path for configuring the protection scope for the Anti-Cryptor task.

When using either a predefined or user protection scope, you can exclude selected folders from the protection scope, for example, if data in these folders is encrypted by programs installed on remote devices.

► **To configure a protection scope for the Anti-Cryptor task:**

1. In the Application Console tree, expand the **Real-Time Server Protection** node.
2. Select the **Anti-Cryptor** child node.
3. Click the **Properties** link in the details pane of the **Anti-Cryptor** node.

   The **Task settings** window opens.

4. On the **Protection area** tab, select the folders that Kaspersky Security for Windows Server will scan when executing the Anti-Cryptor task:

   - **All shared network folders on the server.**

     If this option is selected, when the Anti-Cryptor task is executed, Kaspersky Security for Windows Server scans all of the server’s shared folders.

     This option is selected by default.

   - **Only specified shared folders.**

     If this option is selected, during execution of the Anti-Cryptor task Kaspersky Security for Windows Server protects only the shared server folders that you specified manually.
5. To specify the server’s shared folders, that you want to include in the encryption protection scope, use one of the methods:
   - Manually:
     a. Enter the name of the shared folder on a protected server.
     b. Click the Add button.
        The folder is added to the list.
   - Using the search:
     a. Click the Browse button.
        The standard Microsoft Windows window opens.
     b. Select the folder that you want to add to the protection scope of the task.
     c. Click OK.
6. Click OK.
   The specified settings are saved.

General task settings

To configure the general task settings:

1. In the Application Console tree, expand the Real-Time Server Protection node.
2. Select the Anti-Cryptor child node.
3. Click the Properties link in the details pane of the Anti-Cryptor node.
   The Task settings window opens.
4. In the Work mode section on the General tab, select the Active mode.
   If this mode is selected, Kaspersky Security for Windows Server blocks access to the shared folders for compromised computers, when the malicious encryption attempt is detected.
5. Clear or select the Use heuristic analyzer check box.
   This check box enables / disables Heuristic Analyzer during object scanning.
   If the check box is selected, Heuristic Analyzer is enabled.
   If the check box is cleared, Heuristic Analyzer is disabled.
   The check box is selected by default.
6. If necessary, adjust the level of analysis using the slider.
   The slider allows you to adjust the heuristic analysis level. The scanning intensity level sets the balance between the thoroughness of searches for threats, the load on the operating system’s resources and the time required for scanning.
   The following scanning intensity levels are available:
   - Light. Heuristic analyzer performs fewer operations found inside executable files. The probability of threat detection in this mode is somewhat lower. Scanning is faster and less resource-intensive.
- **Medium**. Heuristic Analyzer performs the number of instructions found within executable files recommended by the experts of Kaspersky Lab. This level is selected by default.

- **Deep**. Heuristic analyzer performs more operations found in executable files. The probability of threat detection in this mode is higher. The scan uses up more system resources, takes more time, and can cause a higher number of false alarms. The slider is available if the **Use heuristic analyzer** check box is selected.

7. **Click OK** to apply new configuration.

**Adding exclusions**

► To configure a protection scope for the Anti-Cryptor task:

1. In the Application Console tree, expand the **Real-Time Server Protection** node.
2. Select the **Anti-Cryptor** child node.
3. Click the **Properties** link in the details pane of the **Anti-Cryptor** node.
   
   The **Task settings** window opens.
4. On the **Exclusions** tab, select the **Apply exclusion list** check box.

   **If the check box is selected, Kaspersky Security for Windows Server does not detect malicious encryption activity that occur in the specified areas, when the Anti-Cryptor task is run.**

   **If the check box is cleared, Kaspersky Security for Windows Server detects encryption activity in all shared folders.**

   By default, the check box is selected and the exclusion list includes following items added by the Kaspersky Lab experts:

   - `*.stt`;
   - `*.sig`;
   - `*.exe`;
   - `*.sldprt`.

1. **Specify a folder name or a mask.**
2. **Click the **Add** button.**
3. **If required, repeat steps 5 and 6 to add more exclusions.**
4. **Click **OK** in the **Task settings** window.**

Protection scope exclusions will be added and applied.
Applications Launch Control

This section contains information about the Applications Launch Control task and how to configure it.

About the Applications Launch Control task

When running the Applications Launch Control task, Kaspersky Security for Windows Server monitors user’s attempts to start applications and allows or denies start of these applications. The Applications Launch Control task relies on the Default Deny principle, which means that any applications that are not allowed in the task settings will be blocked automatically.

You can allow applications to start using one of the following methods:

- Set allowing rules for trusted applications.
- Check trusted applications reputation in KSN on launch.

The task gives top priority to denying the start of applications: if an application is prevented from starting by one of the blocking rules, the application start will be denied regardless of the trusted conclusion for KSN. For example, if the application is not trusted by the KSN services but is included in the scope of an allowing rule, the application start will be denied.

All attempts to start applications are recorded in the task log (see Section "About task logs" on page 208).

The Applications Launch Control task can operate in one of two modes:

- **Active.** Kaspersky Security for Windows Server uses a set of rules to control the start of applications that fall within the scope of the Applications Launch Control rules. The scope of the Applications Launch Control rules is specified in the settings of this task. If an application falls within the scope of the Applications Launch Control rules, and the task settings do not satisfy any specified rule, the application launch will be denied.

  Launches of applications that do not fall within the scope of any rule specified in the Applications Launch Control task settings are allowed regardless of the Applications Launch Control task settings.
The Applications Launch Control task cannot be started in Active mode if no rules have been created or if there are more than 65,535 rules for one server.

- **Statistics only.** Kaspersky Security for Windows Server does not use Applications Launch Control rules to allow or deny the start of applications. Instead, it only records information about application starts, rules satisfied by running applications, and actions that would have been performed if the task was running in Active mode. All applications are allowed to start. This mode is set by default.

You can use this mode to create Applications Launch Control rules (see Section "Creating allowing rules from Applications Launch Control task events" on page 388) based on information recorded in the task log.

You can configure the Applications Launch Control task according to one of the following scenarios:

- Advanced rule configuration (see Section "About Applications Launch Control rules" on page 343) and usage for Application Launch Control.
- Basic rules configuration and KSN usage (see Section "Configuring KSN usage" on page 380) for Application Launch Control.

If operating system files fall within the scope of the Applications Launch Control task, we recommend that when creating Applications Launch Control rules you make sure that such applications are allowed by the newly created rules. Otherwise, the operating system may fail to start.

Kaspersky Security for Windows Server also intercepts processes launched under the Windows Subsystem for Linux (except for scripts run from the UNIX™ shell, or command line interpreters). For such processes, the Applications Launch Control task applies the action defined by the current configuration. The Rule Generator for Applications Launch Control task detects application launches and generates corresponding rules for applications running under the Windows Subsystem for Linux.

### About Applications Launch Control rules

#### How Applications Launch Control rules work

The operation of Applications Launch Control rules is based on the following components:

- **Type of rule.**
  Applications Launch Control rules can allow or deny the start of application. Accordingly, they are called allowing or denying rules. To create a list of allowing rules for Applications Launch Control, you can use the Rule Generator for generating allowing rules or use the Applications Launch Control task in **Statistics only** mode. You can also add allowing rules manually.

- **User and / or user group.**
  Applications Launch Control rules can control the start of specified applications by a user and / or user group.

- **Rule usage scope.**
  Applications Launch Control rules can be applied to executable files, scripts, and MSI packages.

- **Rule-triggering criterion.**
Applications Launch Control rules control the launch of files that satisfy one of the criteria specified in the rule settings: signed by the specified digital certificate, matching the specified SHA256 hash, or located at the specified path.

If Digital certificate is set as the rule-trIGGERing criterion, the created rule controls the start of all trusted applications in the operating system. You can set stricter conditions for this criterion by selecting the following check boxes:

- **Use subject**
  
The check box either enables or disables the use of the subject of the digital certificate as a rule-triggering criterion.

  If the check box is selected, the specified digital certificate subject is used as a rule-triggering criterion. The created rule will control the start of applications only for the vendor specified in the subject.

  If the check box is cleared, the application will not use the subject of the digital certificate as a rule-triggering criterion. If the Digital certificate criterion is selected, the created rule will control the start of applications signed with a digital certificate containing any subject.

  The subject of the digital certificate used to sign the file can be specified only from the properties of the selected file using the Set rule triggering criterion from file properties button located above the Rule triggering criterion section.

  The check box is cleared by default.

- **Use thumb**
  
The check box enables / disables the use of the thumbprint of the digital certificate as a rule-triggering criterion.

  If the check box is selected, the specified digital certificate thumbprint is used as a rule-triggering criterion. The created rule will control the start of applications signed with a digital certificate with the specified thumbprint.

  If the check box is cleared, the application will not use the thumbprint of the digital certificate as a rule-triggering criterion. If the Digital certificate criterion is selected, the application will control the start of applications signed with a digital certificate with any thumbprint.

  The thumbprint of the digital certificate used to sign the file can be specified only from the properties of the selected file using the Set rule triggering criterion from file properties button located above the Rule triggering criterion section.

  The check box is cleared by default.

**Thumbprints allow for the most restrictive triggering of application start rules based on a digital certificate, because a thumbprint uniquely identifies a digital certificate and cannot be forged, unlike the subject of a digital certificate.**

You can specify exclusions for Applications Launch Control rules. Exclusions to Applications Launch Control rules are based on the same criteria used to trigger rules: digital certificate, SHA256 hash, and file path. Exclusions to Applications Launch Control rules may be required for certain allowing rules: for example, if you want to allow users to start applications from the C:\Windows path, while blocking launch of the Regedit.exe file.
If operating system files fall within the scope of the Applications Launch Control task, we recommend that when creating Applications Launch Control rules you make sure that such applications are allowed by the newly created rules. Otherwise, the operating system may fail to start.

Managing Applications Launch Control rules
You can perform the following actions with Applications Launch Control rules:

- Add rules manually.
- Generate and add rules automatically.
- Remove rules.
- Export rules to file.
- Check selected files for rules that allow execution of these files.
- Filter the rules in the list according to specified criterion.

About Software Distribution Control
Generating Applications Launch Control rules can be complicated if you also need to control software distribution on a protected server, for example, on servers where installed software is periodically automatically updated. In this case, the list of allowing rules must be updated after each software update for newly created files to be considered in the Applications Launch Control task settings. To simplify launch control in software distribution scenarios, you can use the Software Distribution Control subsystem.

A software distribution package (hereinafter referred to as “package”) represents a software application to be installed on a server. Each package contains at least one application and may also contain individual files, updates, or even an individual command, in addition to applications, particularly when you are installing a software application or update.

The Software Distribution Control subsystem is implemented as an additional list of exclusions. When you add a software distribution package to this list, the application allows these trusted packages to be decompressed and allows software installed or modified by a trusted package to be started automatically. The extracted files can inherit the trusted attribute of the primary distribution package. A primary distribution package is a package that has been added to the list of Software Distribution Control exclusions by a user and has become a trusted package.

Kaspersky Security for Windows Server controls only full software distribution cycles. The application cannot correctly process the launch of files modified by a trusted package if, when the package is started for the first time, software distribution control is turned off or the Application Launch Control component is not installed.

Software distribution control is not available if the Apply rules to executable files check box is cleared in the Applications Launch Control task settings.
Software distribution cache

Kaspersky Security for Windows Server uses a dynamically generated software distribution cache ("distribution cache") to establishes the relationship between trusted packages and files created during software distribution. When a package is first started, Kaspersky Security for Windows Server detects all files created by the package during the software distribution process and stores file checksums and paths in the distribution cache. Then all files in the distribution cache are allowed to start by default.

You cannot review, clear or manually modify the distribution cache via the user interface. The cache is populated and controlled by Kaspersky Security for Windows Server.

You can export the distribution cache to a configuration file (XML format) and clear the cache using command line options.

To export the distribution cache to a configuration file, execute the following command:

```
 kavshell appcontrol /config /savetofile:<full path> /sdc
```

To clear the distribution cache, execute the following command:

```
 kavshell appcontrol /config /clearsdc
```

Kaspersky Security for Windows Server updates the distribution cache every 24 hours. If the checksum of a previously allowed file is changed, the application deletes the record for this file from the distribution cache. If the Applications Launch Control task is started in Active mode, subsequent attempts to start this file will be blocked. If the full path to the previously allowed file is changed, subsequent attempts to start this file will not be blocked, because the checksum is stored within the distribution cache.

Processing the extracted files

All files extracted from a trusted package inherit the trusted attribute upon first launch of the package. If you clear the check box after first launch, all files extracted from the package will retain the inherited attribute. To reset the inherited attribute on all extracted files, you need to clear the distribution cache and clear the Allow launching to all files from this distribution package extraction chain check box before starting the trusted distribution package again.

Extracted files and packages created by a trusted primary distribution package inherit the trusted attribute when their checksums are added to the distribution cache when the software distribution package in the exclusion list is opened for the first time. Hence, the distribution package itself and all files extracted from this package will also be trusted. By default, the number of levels of inheritance of the trusted attribute is unlimited.

Extracted files will retain the trusted attribute after the operating system restarts.

The processing of files is configured in the Software Distribution Control settings (see Section "Configuring Software Distribution Control" on page 357) by selecting or clearing the Allow launching to all files from this distribution package extraction chain check box.

For example, suppose you add a test.msi package containing several other packages and applications to the exclusions list and select the check box. In this case, all packages and applications contained in the test.msi package are allowed to run or be extracted if they contain other files. This scenario works for extracted files on all nested levels.

If you add a test.msi package to the exclusions list and clear the Allow launching to all files from this distribution package extraction chain check box, the application will assign the trusted attribute only to the
packages and executable files extracted directly from the primary trusted package (on the first level of nesting). The checksums of such files are stored in the distribution cache. All files on the second level of nesting and beyond will be blocked by the Default Deny principle.

**Working with the Applications Launch Control rule list**

The list of trusted packages of software distribution control subsystem is a list of exclusions, which amplifies, but does not replace the general list of applications launch control rules.

Denying applications launch control rules have the highest priority: trusted package decompression and start of new or modified files will be blocked, if these packages and files are affected by the applications launch control denying rules.

Software distribution control exclusions are applied both for trusted packages and files created or modified by these packages, if no denying rules in the applications launch control list are applied for those packages and files.

**Using KSN conclusions**

KSN conclusions that a file is untrusted have a higher priority than the software distribution control exclusions: decompression of trusted packages and start of files created or modified by these packages will be blocked if KSN reports that these files are untrusted.

**About KSN usage for the Applications Launch Control task**

To start the KSN Usage task, you must accept the KSN Statement.

If KSN data about an application’s reputation is used by the Applications Launch Control task, the KSN application reputation is considered a criterion for allowing or denying launch of that application. If KSN reports to Kaspersky Security for Windows Server that an application is untrusted when the user attempts to launch the application, the application launch is denied. If KSN reports to Kaspersky Security for Windows Server that the application is trusted when the user attempts to launch the application, the application launch is allowed. KSN can be used along with Applications Launch Control rules or as an independent criterion for denying launch of applications.

**Using KSN conclusions as independent criterion for denying application launch**

This scenario lets you securely control application launches on a protected server without requiring advanced configuration of the rule list.

You can apply KSN conclusions to Kaspersky Security for Windows Server together with the only specified rule. The application will only allow the start of applications that are trusted in KSN or are allowed by a specified rule.

For such a scenario, we recommend that you set a rule allowing start of the application based on a digital certificate.

All other applications are denied in accordance with the Default Deny policy. Using KSN when no rules are applied protects a computer from applications that KSN considers to be a threat.
Using KSN conclusions simultaneously with Applications Launch Control rules

When using KSN conclusions simultaneously with Applications Launch Control rules, the following conditions apply:

- Kaspersky Security for Windows Server always denies launch of an application if it is included in the scope of at least one denying rule. If the application is considered trusted by KSN, the corresponding conclusion has a lower priority and is not considered; the application launch will still be denied. This lets you expand the list of unwanted applications.

- Kaspersky Security for Windows Server always denies the launch of an application if the launch of applications not trusted in KSN is prohibited and the application is not trusted in KSN. If an allowing rule is set for the application, it has a lower priority and is not considered; the application launch will still be denied. This protects the computer from applications that KSN considers to be a threat but were not considered during initial configuration of the rules.

Generating Applications Launch Control rules

You can create lists of Applications Launch Control rules using Kaspersky Security Center tasks and policies simultaneously for all servers and groups of servers on the corporate network. This scenario is recommended if the corporate network does not have a reference machine and you are unable to create a list of allowing rules based on applications installed on the reference machine. You can also run the Rule Generator for Applications Launch Control task locally via the Application Console to create a list of rules based on the applications running on a single server.

The Applications Launch Control component is installed with two preset allowing rules:

- Allowing rule for scripts and MSI files with a certificate trusted by the operating system.
- Allowing rule for executable files with a certificate trusted by the operating system.

You can create lists of Applications Launch Control rules on the side of Kaspersky Security Center in one of the following ways:

- Using a Rule Generator for Applications Launch Control group task.

  Under this scenario, a group task generates its own list of Applications Launch Control rules for each server on the network and saves those lists to an XML file in the specified shared folder. The XML file generated by the Rule Generator for Applications Launch Control task contains the allowing rules specified in task settings before the task starts. No rules will be created for applications that are not allowed to start in the specified task settings. The start of such applications is denied by default. You can then manually import the created list of rules into the Applications Launch Control task for the Kaspersky Security Center policy. You can automatically add the created rules to the Applications Launch Control rule list when the Rule Generator for Applications Launch Control group task is finished.

  You can configure the generated rules to be automatically imported into the list of rules for the Applications Launch Control task.

  This scenario is recommended when you need to quickly create lists of Applications Launch Control rules. We recommend that you configure the scheduled launch of the Rule Generator for Applications Launch Control task only if the applied allowing rules include folders and files you know to be safe.
Before using the Applications Launch Control task in the network, make sure that all protected servers have access to a shared folder. If the organization’s policy does not provide for the use of a shared folder in the network, we recommend that you start the Rule Generator for Applications Launch Control task on a server in the test servers group or on a reference machine.

- Based on a report of task events generated in Kaspersky Security Center by the Applications Launch Control task running in **Statistics only** mode.

Under this scenario, Kaspersky Security for Windows Server does not deny the launch of applications. Instead, with Applications Launch Control running in the **Statistics only** mode, it reports all allowed and denied application launches across all network servers in the **Events** section of Kaspersky Security Center. Kaspersky Security Center uses the task log to generate a single list of events in which application launches were denied.

You need to configure the task execution period so that all possible scenarios involving the protected servers and server groups, and at least one server restart are performed during the specified time period. After rules are added to the Applications Launch Control task, you can import application launch data from the saved Kaspersky Security Center event report (TXT format) and generate Applications Launch Control allowing rules for such applications based on this data.

This scenario is recommended if a corporate network includes a large number of servers of different type (see Section "Using a profile to configure Applications Launch Control tasks in a Kaspersky Security Center policy" on page 374) (with a different software installed).

- Based on denied application launch events received through Kaspersky Security Center, without creating and importing a configuration file.

To use this feature, the Applications Launch Control task on the local computer must be running under an active Kaspersky Security Center policy. In this case, all events on the local computer are sent to the Administration Server.

We recommend that you update the list of rules when the set of applications installed on network servers changes (for example, when updates are installed or operating systems are reinstalled). We recommend that you generate an updated list of rules by running the Rule Generator for Applications Launch Control task or the Applications Launch Control task in **Statistics only** mode on servers in the test administration group. The test administration group includes the servers required to test the launch of new applications before they are installed on network servers.

XML files containing lists of allowing rules are created based on an analysis of tasks started on the protected server. To account for all applications used on the network when generating lists of rules you are advised to start the Rule Generator for Applications Launch Control task and the Applications Launch Control task in **Statistics only** mode on a reference machine.

Before generating allowing rules based on the applications launched on a reference machine, make sure that the reference machine is secure and there is no malware on it.

Before adding allowing rules, select one of the available rule application modes. The list of Kaspersky Security Center policy rules displays only rules specified by the policy, regardless of the rule application mode. The local rule list includes all applied rules — both local rules and rules added through a policy.
### Default Applications Launch Control task settings

By default, the Applications Launch Control task has the settings described in the table below. You can change the values of these settings.

<table>
<thead>
<tr>
<th>Setting</th>
<th>Default Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Task mode</strong></td>
<td><strong>Statistics only</strong>. The task records denied launch events and allowed launch events based on the set rules. Application launch is not actually denied.</td>
<td>You can select <strong>Active</strong> mode after the final list of rules is generated.</td>
</tr>
<tr>
<td><strong>Repeat actions taken for the first file launch on all the subsequent launches for this file</strong></td>
<td>Applied</td>
<td>You can repeat actions taken for the first file launch on all the subsequent launches for this file.</td>
</tr>
<tr>
<td><strong>Deny the command line interpreters launch with no command to execute</strong></td>
<td>Not applied.</td>
<td>You can deny launch of command interpreters with no command to execute.</td>
</tr>
<tr>
<td><strong>Rules managing</strong></td>
<td>Replace local rules with policy rules</td>
<td>You can select a mode in which rules specified in a policy are applied together with the rules on the local computer.</td>
</tr>
<tr>
<td><strong>Rules usage scope</strong></td>
<td>The task controls the launch of executable files, scripts, and MSI packages.</td>
<td>You can specify the file types for which launch is controlled by rules.</td>
</tr>
<tr>
<td><strong>KSN Usage</strong></td>
<td>KSN application reputation data is not used.</td>
<td>You can use KSN application reputation data when running the Applications Launch Control task.</td>
</tr>
<tr>
<td><strong>Automatically allow software distribution for applications and packages listed</strong></td>
<td>Not applied.</td>
<td>You can allow software distribution using the installers and applications specified in the settings. By default, software distribution is only allowed using the Windows Installer service.</td>
</tr>
</tbody>
</table>
Applications Launch Control

<table>
<thead>
<tr>
<th>Setting</th>
<th>Default Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Always allow software distribution via Windows Installer</td>
<td>Applied (can be changed only when the Automatically allow software distribution for applications and packages listed setting is enabled).</td>
<td>You can allow any software installation or update if the operations are performed via Windows Installer.</td>
</tr>
<tr>
<td>Always allow software distribution via SCCM using the Background Intelligent Transfer Service</td>
<td>Not applied (can be changed only when the Automatically allow software distribution for applications and packages listed setting is enabled).</td>
<td>You can turn on or off automatic software distribution using the System Center Configuration Manager.</td>
</tr>
<tr>
<td>Task start</td>
<td>First run is not scheduled.</td>
<td>The Applications Launch Control task does not start automatically at start of Kaspersky Security for Windows Server. You can start the task manually or configure a scheduled start.</td>
</tr>
</tbody>
</table>

Table 57. Rule Generator for Applications Launch Control task default settings

<table>
<thead>
<tr>
<th>Setting</th>
<th>Default Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Prefix for allowing rules names</td>
<td>Identical to the name of the server on which Kaspersky Security for Windows Server is installed.</td>
<td>You can change the prefix for names of allowing rules.</td>
</tr>
<tr>
<td>Allowing rules usage scope</td>
<td>The scope of allowing rules includes the following file categories by default: Files with the EXE extension located in the folders C:\Windows, C:\Program Files (x86) and C:\Program Files • MSI packages stored in the C:\Windows folder • Scripts stored in the C:\Windows folder The task also creates rules for all running applications, regardless of their location and format.</td>
<td>You can change the protection scope by adding or removing folder paths and specifying the types of files that will be allowed to launch by the automatically generated rules. You can also ignore running applications when creating allowing rules.</td>
</tr>
</tbody>
</table>
### Setting | Default Value | Description
--- | --- | ---
Criteria for generation of allowing rules | The digital certificate subject and thumbprint are used; rules are generated for all users and groups of users. | You can use the SHA256 hash when generating allowing rules. You can select a user and group of users for which allowing rules need to be automatically generated.
Actions upon task completion | Allowing rules are added to the list of Applications Launch Control rules; new rules are merged with existing rules; duplicate rules are removed. | You can add rules to the existing rules without merging them and without deleting duplicate rules, or replace existing rules with the new allowing rules, or configure export of the allowing rules to a file.
Task launch settings with permissions | The task is started under a system account. | You can allow the Rule Generator for Applications Launch Control task to start under a system account or using the permissions of a specified user.
Task start schedule | First run is not scheduled. | The Rule Generator for Applications Launch Control task does not start automatically when Kaspersky Security for Windows Server starts. You can start the task manually or configure a scheduled start.

## Managing Applications Launch Control via the Administration Plug-in

In this section, learn how to navigate the Administration Plug-In interface and configure task settings for one or all servers on the network.

Navigation

Learn how to navigate to the required task settings via the interface.

In this section

- Opening policy settings for the Applications Launch Control task.......................................................... 353
- Opening the Applications Launch Control rules list...................................................................................... 353
- Opening the Rule Generator for Applications Launch Control task wizard and properties....................... 354

Opening policy settings for the Applications Launch Control task

► To open the Applications Launch Control task settings via the Kaspersky Security Center policy:

1. Expand the Managed devices node in the Kaspersky Security Center Administration Console tree.
2. Select the administration group for which you want to configure the task.
3. Select the Policies tab.
4. Double-click the policy name you want to configure.
5. In the Properties: <Policy name> window that opens, select the Local activity control section.
6. Click the Settings button in the Applications Launch Control subsection.
   The Applications Launch Control window opens.
   Configure the policy as required.

Opening the Applications Launch Control rules list

► To open the Applications Launch Control rules list via the Kaspersky Security Center:

1. Expand the Managed devices node in the Kaspersky Security Center Administration Console tree.
2. Select the administration group for which you want to configure the task.
3. Select the Policies tab.
4. Double-click the policy name you want to configure.
5. In the Properties: <Policy name> window that opens, select the Local activity control section.
6. Click the Settings button in the Applications Launch Control subsection.
   The Applications Launch Control window opens.
7. On the General tab, click the Rules list button.
   The Applications Launch Control rules window opens.
   Configure the rules list as required.
Opening the Rule Generator for Applications Launch Control task wizard and properties

► To start creating a Rule Generator for Applications Launch Control task:

1. Expand the Managed devices node in the Kaspersky Security Center Administration Console tree.
2. Select the administration group for which you want to configure the task.
3. Select the Tasks tab.
4. Click Create a task button. The New Task Wizard window opens.
5. Select the Rule Generator for Applications Launch Control task.
6. Click Next. The Settings window opens.

► To configure the existing Rule Generator for Applications Launch Control task:

1. Expand the Managed devices node in the Kaspersky Security Center Administration Console tree.
2. Select the administration group for which you want to configure the task.
3. Select the Tasks tab.
4. Double-click the task name in the list of Kaspersky Security Center tasks. The Properties: Rule Generator for Applications Launch Control window opens.

See the Configuring the Rule Generator for Applications Launch Control task section for details on configuring the task.

Configuring Applications Launch Control task settings

► To configure general Applications Launch Control task settings:

1. Open the Applications Launch Control (see Section "Opening policy settings for the Applications Launch Control task" on page 353) window.
2. On the General tab, select the following settings in the Task mode section:
   - In the Task mode drop-down list, specify the task mode.

   In this drop-down list, you can select the Applications Launch Control task’s mode:
   - Active. Kaspersky Security for Windows Server uses the specified rules to control the launch of any application.
   - Statistics only. Kaspersky Security for Windows Server does not use the specified rules to control application launches. Instead, it simply records information about launch events in the task log. All applications are allowed to start. You can use this mode to generate a list of Applications Launch Control rules based on the information about denied application launches recorded in the task log.

   By default, the Applications Launch Control task runs in Statistics only mode.
• Clear or select the **Repeat action taken for the first file launch on all the subsequent launches for this file** check box.

The check box enables or disables launch control for the second and subsequent attempts to start applications based on the event information stored in the cache.

If the check box is selected, Kaspersky Security for Windows Server allows or denies subsequent launches of an application based on the task’s conclusion regarding the first launch of the application. For example, if the first application launch was allowed by the rules, information about this decision will be stored in the cache, and the second and all subsequent launches will also be allowed without rechecking.

If the check box is cleared, Kaspersky Security for Windows Server analyzes an application every time a launch is attempted.

The check box is selected by default.

• Clear or select the **Deny the command line interpreters launch with no command to execute** check box.

If the check box is selected, Kaspersky Security for Windows Server denies the launch of command line interpreters even if launching interpreters is allowed. A command interpreter can only be launched with no command if both of the following conditions are met:

• Launch of the command line interpreter is allowed.

• The command to be executed is allowed.

If the check box is cleared, Kaspersky Security for Windows Server only considers allowing rules when launching a command line interpreter. The launch is denied if no allowing rule applies or the executable process is not trusted by KSN. If an allowing rule applies or the process is trusted by KSN, a command line interpreter can be launched with or without a command to execute.

Kaspersky Security for Windows Server recognizes the following command line interpreters:

• cmd.exe

• powershell.exe

• python.exe

• perl.exe

The check box is cleared by default.

3. In the **Rules managing** section, configure settings for applying rules:

   a. Click the **Rules list** button to add allowing rules for the Applications Launch Control task.

   Kaspersky Security for Windows Server does not recognize paths that contain slashes ("/"). Use backslash ("\") to enter the path correctly.
b. Select the mode for applying rules:

- **Replace local rules with policy rules.**
  The application applies the rule list specified in the policy for centralized application launch control on a group of computers. Local rule lists cannot be created, edited, or applied.

- **Add policy rules to the local rules.**
  The application applies the rule list specified in a policy together with local rule lists. You can edit the local rule lists using the Rule Generator for Applications Launch Control task.

By default, Kaspersky Security for Windows Server applies two preset rules that allow a list of scripts, MSI packages, and executable files if these objects are signed with a trusted digital signature.

4. In the **Rules usage scope** section, specify the following settings:

- **Apply rules to executable files.**
  The check box either enables or disables launch control of executable files.
  - If this check box is selected, Kaspersky Security for Windows Server allows or blocks start of executable files using the specified rules whose settings specify **Executable files** as the scope.
  - If this check box is cleared, Kaspersky Security for Windows Server does not control start of executable files using the specified rules. Startup of executable files is allowed.
  The check box is selected by default.

- **Monitor loading of DLL modules.**
  The check box either enables or disables control of loading of DLL modules.
  - If this check box is selected, Kaspersky Security for Windows Server allows or blocks loading of DLL modules using the specified rules whose settings specify **Executable files** as the scope.
  - If this check box is cleared, Kaspersky Security for Windows Server does not control loading of DLL modules using the specified rules. Loading of DLL modules is allowed.
  The check box is active if the **Apply rules to executable files** check box is selected.
  The check box is cleared by default.

Controlling loading of DLL modules may affect the performance of the operating system.

- **Apply rules to scripts and MSI packages.**
  The check box either enables or disables launch of scripts and MSI packages.
  - If this check box is selected, Kaspersky Security for Windows Server allows or blocks start of scripts and MSI packages using the specified rules whose settings specify **Scripts and MSI packages** as the scope.
  - If this check box is cleared, Kaspersky Security for Windows Server does not control start of scripts and MSI packages using specified rules. Start of scripts and MSI packages is allowed.
  The check box is selected by default.
5. In the **KSN Usage** group box, configure the following application launch settings:

- **Deny applications untrusted by KSN.**
  
  The check box either enables or disables Applications Launch Control according to application reputation data in KSN.
  
  If this check box is selected, Kaspersky Security for Windows Server blocks any application from running if it is not trusted in KSN. Applications Launch Control allowing rules that apply to applications not trusted in KSN will not be triggered. Selecting the check box provides additional protection from malware.
  
  If the check box is cleared, Kaspersky Security for Windows Server does not consider the reputation of applications not trusted in KSN and allows or blocks start in accordance with the rules that apply to such applications.
  
  The check box is cleared by default.

- **Allow applications trusted by KSN.**
  
  The check box either enables or disables Applications Launch Control according to application reputation data in KSN.
  
  If this check box is selected, Kaspersky Security for Windows Server allows applications to run if they are trusted in KSN. Denying application launch control rules that apply to KSN-trusted applications have higher priority: if an application is trusted by KSN services, the application launch will be denied.
  
  If the check box is cleared, Kaspersky Security for Windows Server does not consider the reputation of KSN-trusted applications and allows or denies launch in accordance with rules that apply to such applications.
  
  The check box is cleared by default.

- **Users and / or user groups allowed to launch applications trusted in KSN.**

6. On the **Software Distribution Control** tab, configure the settings for software distribution control (see Section "Configuring Software Distribution Control" on page 357).

7. On the **Task management** tab, configure the scheduled task start settings (see Section "Configuring the task start schedule settings" on page 134).

8. Click **OK** in the **Task settings** window.

Kaspersky Security for Windows Server immediately applies the new settings to the running task. Information about the date and time when the settings were modified, and the values of task settings before and after modification, are saved in the system audit log.

### Configuring Software Distribution Control

- **To add a trusted distribution package:**
  
  1. Open the **Applications Launch Control** window (see Section "Opening policy settings for the Applications Launch Control task" on page 353).
  2. On the **Software Distribution Control** tab, select the **Automatically allow software distribution for applications and packages listed** check box.

The check box enables and disables automatic creation of exclusions for all files started using the distribution packages specified in the list.
If the check box is selected, the application automatically allows files in the trusted distribution packages to start. The list of applications and distribution packages allowed to start can be edited.

If the check box is cleared, the application does not apply the exclusions specified in the list.

The check box is cleared by default.

You can select the Automatically allow software distribution for applications and packages listed, if the Apply rules to executable files check box in the General tab is selected in the Applications Launch Control task settings.

3. Clear the Always allow software distribution via Windows Installer check box if required.

   The check box enables and disables automatic creation of exclusions for all files executed via Windows Installer.

   If the check box is selected, files installed via Windows Installer will always be allowed to start.

   If the check box is cleared, files will not be allowed to start unconditionally, even if they are started via Windows Installer.

   The check box is selected by default.

   The check box is not editable if the Automatically allow software distribution for applications and packages listed check box is not selected.

   Clearing the Always allow software distribution via Windows Installer check box is only recommended if it is absolutely necessary. Turning off this function may cause issues with updating operating system files and also prevent the launch of files extracted from a distribution package.

4. If required, select the Always allow software distribution via SCCM using the Background Intelligent Transfer Service check box.

   The check box turns on or off automatic software distribution using the System Center Configuration Manager.

   If the check box is selected, Kaspersky Security for Windows Server automatically allows Microsoft Windows deployment using the System Center Configuration Manager. The application allows software distribution only via the Background Intelligent Transfer Service.

   The application controls start of objects with the following extensions:
   - .exe
   - .msi

   The check box is cleared by default.

   The application controls the software distribution cycle on the server — from package delivery to installation or update. The application does not control processes if any stage of distribution was performed before installation of the application on the server.
5. To edit the list of trusted distribution packages, click **Change packages list** and select one of the following methods in the window that opens:

- **Add one distribution package.**
  a. Click the **Browse** button and select the executable file or distribution package.
     The **Trusting criteria** section is automatically populated with data about the selected file.
  b. Clear or select the **Allow launching to all files from this distribution package extraction chain** check box.
  c. Select one of two available options for criteria to use to determine whether a file or distribution package is trusted:
    - **Use digital certificate**
      If this option is selected, the presence of a digital certificate is specified as a rule-triggering criterion in the settings of the newly generated allowing rules for Applications Launch Control. The application will now allow start of programs launched using files with a digital certificate. We recommend this option if you want to allow the start of any applications that are trusted in the operating system.

      This option is selected by default.
    - **Use SHA256 hash**
      If this option is selected, the checksum of the file used to generate the rule is specified as a rule-triggering criterion in the settings of the newly generated allowing rules for Applications Launch Control. The application will allow start of programs launched using files with the specified checksum.

      We recommend this option for cases when the generated rules must achieve the highest level of security: a SHA256 checksum may be used as a unique file ID. Using a SHA256 checksum as a rule-triggering criterion restricts the rule usage scope to one file.

      This option is cleared by default.
  - **Add several packages by hash.**

    You can select an unlimited number of executable files and distribution packages, and add them to the list all at the same time. Kaspersky Security for Windows Server examines the hash and allows the operating system to launch the specified files.

  - **Change selected package.**
    Use this option to select a different executable file or distribution package, or to change the trust criteria.

  - **Import distribution packages list from file.**
    You can import the list of trusted distribution packages from a configuration file. To be recognized by Kaspersky Security for Windows Server, such a file must satisfy the following parameters:
    - The file extension is TXT.
    - The file contains information structured as a list of lines, where each line includes data for one of the trusted files.
- The file must contain a list in one of the following formats:
  - `<file name>:<SHA256 hash>`.
  - `<SHA256 hash>`.<file name>.

  In the **Open** window, specify the configuration file containing a list of trusted distribution packages.

6. If you want to remove a previously added application or distribution package for the trusted list, click the **Delete distribution packages** button. Extracted files will be allowed to run.

   To prevent extracted files from starting, uninstall the application on the protected server or create a denying rule in the Applications Launch Control task settings.

7. Click **OK**.

   Your newly configured settings are saved.

### Configuring the Rule Generator for Applications Launch Control task

To configure the Rule Generator for Applications Launch Control task, do the following:

1. Open the **Properties: Rule Generator for Applications Launch Control** (see Section "Opening the Rule Generator for Applications Launch Control task wizard and properties" on page 354) window.

2. In the **Notification** section, configure the task event notification settings.

   For detailed information regarding configuring settings in this section, see the *Kaspersky Security Center Help*.

3. In the **Settings** section, you can configure the following settings:
   - Add prefix for rule names.
   - Configure the allowing rules usage scope:
     - Create allowing rules based on running applications;
     - Create allowing rules for applications from the specific folders.

4. In the **Options** section, you can specify actions to perform while creating allowing rules for applications launch control:
   - **Use digital certificate**
     
     If this option is selected, the presence of a digital certificate is specified as a rule-triggering criterion in the settings of the newly generated allowing rules for Applications Launch Control. The application will now allow start of programs launched using files with a digital certificate. We recommend this option if you want to allow the start of any applications that are trusted in the operating system.

     This option is selected by default.
• **Use digital certificate subject and thumbprint**

  The check box enables or disables the use of the subject and thumbprint of the file's digital certificate as a criterion for triggering the allowing rules for Applications Launch Control. Selecting this check box lets you specify stricter digital certificate verification conditions.

  If this check box is selected, the subject and thumbprint values of the digital certificate of files for which the rules are generated are set as a criterion for triggering the allowing rules for Applications Launch Control. Kaspersky Security for Windows Server will allow applications that are launched using files with the specified thumbprint and digital certificate.

  Selecting this check box highly restricts the triggering of allowing rules based on a digital certificate because a thumbprint is a unique identifier of a digital certificate and cannot be forged.

  If this check box is cleared, the existence of any digital certificate that is trusted in the operating system is set as a criterion for triggering the allowing rules for Applications Launch Control.

  This check box is active if the **Use digital certificate** option is selected.

  The check box is selected by default.

• **If the certificate is missing, use**

  This is a drop-down list that allows you to select the criterion for triggering an allowing rule for Applications Launch Control if the file used to generate the rule, has no digital certificate.

• **SHA256 hash.** The checksum of the file used to generate the rule is set as a criterion for triggering the allowing rule for Applications Launch Control. The application will allow start of programs launched using files with the specified checksum.

• **path to file.** The path to the file used to generate the rule is set as a criterion for triggering the allowing rule for Applications Launch Control. The application will now allow start of programs launched using files located in the folders specified in the Create allowing rules for applications from the folders table in the **Settings** section.

• **Use SHA256 hash**

  If this option is selected, the checksum of the file used to generate the rule is specified as a rule-triggering criterion in the settings of the newly generated allowing rules for Applications Launch Control. The application will allow start of programs launched using files with the specified checksum.

  We recommend this option for cases when the generated rules must achieve the highest level of security: a SHA256 checksum may be used as a unique file ID. Using a SHA256 checksum as a rule-triggering criterion restricts the rule usage scope to one file.

  This option is cleared by default.

• **Generate rules for user or group of users.**

  This is a field that displays a user or group of users. The application will control any applications run by the specified user or group of users.

  The default selection is **Everyone**.

You can configure settings for configuration files with allowing rules lists that Kaspersky Security for Windows Server creates upon the task completion.
5. Configure the task schedule in the **Schedule** section (you can configure a schedule for all task types except Rollback of Database Update).

6. In the **Account** section specify the account which rights will be used for the task execution.

7. If required, specify the objects to exclude from the task scope in the **Exclusions from task scope** section.

   For detailed information regarding configuring settings in these sections, see the *Kaspersky Security Center Help*.

8. In the **Properties: <Task name>** window, click **OK**.

   The newly configured group tasks settings are saved.

---

### Configuring Applications Launch Control rules via the Kaspersky Security Center

Learn how to generate a list of rules based on various criteria or manually create allowing or denying rules using the Application Launch Control task.

**In this section**

- Adding an Applications Launch Control rule ........................................................................ 362
- Enabling the Default Allow mode ..................................................................................... 365
- Creating allowing rules from Kaspersky Security Center events ........................................ 365
- Importing rules from a Kaspersky Security Center report on blocked applications ............ 366
- Importing Applications Launch Control rules from an XML file ........................................ 368
- Checking application launches ......................................................................................... 369

---

### Adding an Applications Launch Control rule

**To add an Applications Launch Control rule:**

1. Open the **Applications Launch Control rules** window (see Section "Opening the Applications Launch Control rules list" on page 353).

2. Click the **Add** button.

3. In the context menu of the button, select **Add one rule**.

   The **Rule settings** window opens.

4. Specify the following settings:

   a. In the **Name** field, enter the name of the rule.

   b. In the **Type** drop-down list, select the rule type:

      - **Allowing** if you want the rule to allow launch of applications in accordance with the criteria specified in the rule settings.
- **Denying** if you want the rule to block launch of applications in accordance with the criteria specified in the rule settings.

c. In the **Scope** drop-down list, select the type of files whose execution will be controlled by the rule:

- **Executable files** if you want the rule to control launch of executable files.
- **Scripts and MSI packages** if you want the rule to control launch of scripts and MSI packages.

d. In the **User or user group** field, specify the users who will be allowed or not allowed to start programs based on the type of rule. To do this, perform the following actions:

i. Click the **Browse** button.

ii. The standard Microsoft Windows **Select user or groups** window opens.

iii. Specify the list of users and/or user groups.

iv. Click **OK**.

e. If you want to take the values of the rule-triggering criteria listed in the **Rule triggering criterion** section from a specific file:

i. Click the **Set rule triggering criterion from file properties** button.

   The standard Microsoft Windows **Open** window opens.

ii. Select the file.

iii. Click the **Open** button.

   The criteria values in the file are displayed in the fields in the **Rule triggering criterion** section. The criterion for which data are available in the file properties is selected by default.

f. In the **Rule triggering criterion** section, select one of the following options:

- **Digital certificate** if you want the rule to control the start of applications launched using files signed with a digital certificate:
  
  - Select the **Use subject** check box if you want the rule to control the launch of files signed with a digital certificate only with the specified header.
  
  - Select the **Use thumb** check box if you want the rule to only control the launch of files signed with a digital certificate with the specified thumbprint.

- **SHA256 hash** if you want the rule to control the start of programs launched using files whose checksum matches the one specified.

- **Path to file** if you want the rule to control the start of programs launched using files located at the specified path.

   Kaspersky Security for Windows Server does not recognize paths that contain slashes ("/"). Use backslash ("\") to enter the path correctly.

g. If you want to add rule exclusions:

i. In the **Exclusions from rule** section, click the **Add** button.

   The **Exclusion from rule** window opens.

ii. In the **Name** field, enter the name of the exclusion.
iii. Specify the settings for exclusion of application files from the Applications Launch Control rule. You can fill out the settings fields from the file properties by clicking the Set exclusion based on file properties button.

- **Digital certificate**
  If this option is selected, the presence of a digital certificate is specified as a rule-triggering criterion in the settings of the newly generated allowing rules for Applications Launch Control. The application will now allow start of programs launched using files with a digital certificate. We recommend this option if you want to allow the start of any applications that are trusted in the operating system.
  
  This option is selected by default.

- **Use subject**
  The check box either enables or disables the use of the subject of the digital certificate as a rule-triggering criterion. 
  
  If the check box is selected, the specified digital certificate subject is used as a rule-triggering criterion. The created rule will control the start of applications only for the vendor specified in the subject.
  
  If the check box is cleared, the application will not use the subject of the digital certificate as a rule-triggering criterion. If the Digital certificate criterion is selected, the created rule will control the start of applications signed with a digital certificate containing any subject.
  
  The subject of the digital certificate used to sign the file can be specified only from the properties of the selected file using the Set rule triggering criterion from file properties button located above the Rule triggering criterion section.
  
  The check box is cleared by default.

- **Use thumb**
  The check box enables / disables the use of the thumbprint of the digital certificate as a rule-triggering criterion.
  
  If the check box is selected, the specified digital certificate thumbprint is used as a rule-triggering criterion. The created rule will control the start of applications signed with a digital certificate with the specified thumbprint.
  
  If the check box is cleared, the application will not use the thumbprint of the digital certificate as a rule-triggering criterion. If the Digital certificate criterion is selected, the application will control the start of applications signed with a digital certificate with any thumbprint.
  
  The thumbprint of the digital certificate used to sign the file can be specified only from the properties of the selected file using the Set rule triggering criterion from file properties button located above the Rule triggering criterion section.
  
  The check box is cleared by default.

- **SHA256 hash**
  If this option is selected, the checksum of the file used to generate the rule is specified as a rule-triggering criterion in the settings of the newly generated allowing rules for Applications Launch Control. The application will allow start of programs launched using files with the specified checksum.
  
  We recommend this option for cases when the generated rules must achieve the highest level of security: a SHA256 checksum may be used as a unique file ID. Using a SHA256 checksum as a rule-triggering criterion restricts the rule usage scope to one file.
This option is cleared by default.

- **Path to file**
  
  If the check box is selected, Kaspersky Security for Windows Server uses the full path to the file to determine whether the process is trusted.

  If the check box is cleared, the path to the file is not used to determine whether the process is trusted.

  The check box is cleared by default.

  iv. Click OK.

  v. If necessary, repeat steps (i)-(iv) to add additional exclusions.

  5. Click OK in the Rule settings window.

  The created rule is displayed in the list in the **Applications Launch Control rules** window.

**Enabling the Default Allow mode**

Default Allow mode allows all applications to start if they are not blocked by rules or by a conclusion from KSN that they are not trusted. Default Allow mode can be enabled by adding specific allowing rules. You can enable Default Allow for only scripts or for all executable files.

► *To add a Default Allow rule:*

1. Open the Applications Launch Control rules (see Section “Opening the Applications Launch Control rules list” on page 353) window.

2. Click the Add button and, in the button’s context menu, select Add one rule.

   The Rule settings window opens.

3. In the Name field, enter the name of the rule.

4. In the Type drop-down list, select the Allowing rule type.

5. In the Scope drop-down list, select the type of files whose execution will be controlled by the rule:

   - **Executable files** if you want the rule to control the launch of executable files.
   - **Scripts and MSI packages** if you want the rule to control the launch of scripts and MSI packages.

6. In the Rule triggering criterion section, select the Path to file option.

7. Enter the following mask: ? : \.

8. Click OK in the Rule settings window.

   Kaspersky Security for Windows Server applies the Default Allow mode.

**Creating allowing rules from Kaspersky Security Center events**

► *To generate allowing rules for applications from Kaspersky Security Center events in Applications Launch Control:*

1. Open the Applications Launch Control rules (see Section “Opening the Applications Launch Control rules list” on page 353) window.
2. Click the **Add** button and, in the button’s context menu, select **Create allowing rules for applications from Kaspersky Security Center events**.

3. Select the principle for adding the rules to the list of previously created Application Launch Control rules:
   - **Add to existing rules** if you want to add the imported rules to the list of existing rules. Rules with identical settings are duplicated.
   - **Replace existing rules** if you want to replace the existing rules with the imported rules.
   - **Merge with existing rules** if you want to add the imported rules to the list of existing rules. Rules with identical settings are not added; the rule is added if at least one rule parameter is unique.

The **Applications launch control rules generation** window opens.

4. Configure the following request settings:
   - **Administration Server address**
   - **Port**
   - **User**
   - **Password**

5. Select the types of events that you want the rule generation task to use:
   - **Statistics only mode: application launch denied**.
   - **Application launch denied**.

6. Select the time period from the **Request events that were generated within the period** drop-down list.

7. Click the **Generate rules** button.

8. Click the **Save** button in the **Applications Launch Control rules** window.

   The rule list in the Applications Launch Control task will be populated with new rules generated based on system data from the server with the Kaspersky Security Center Administration Console installed.

   **If the list of Application Launch Control rules is already specified in the policy, Kaspersky Security for Windows Server adds the selected rules from the blocking events to the already specified rules. Rules with the same hash are not added, because all rules in the list must be unique.**

---

**Importing rules from a Kaspersky Security Center report on blocked applications**

You can import data on blocked application launches from a report generated in Kaspersky Security Center after the Applications Launch Control task is run in **Statistics only** mode and use this data to generate a list of Applications Launch Control allowing rules in the policy being configured.

When generating a report on events occurring during the Applications Launch Control task, you can keep track of the applications whose launch is blocked.

**When importing data from a report on blocked applications into policy settings, make sure that the list you are using contains only applications whose launch you want to allow.**
To specify Applications Launch Control allowing rules for a group of servers based on a blocked applications report from Kaspersky Security Center:

1. Open the Applications Launch Control window (see Section "Opening policy settings for the Applications Launch Control task" on page 353).
2. In the Task mode section, select Statistics only mode.
3. In the policy properties in the Event notification section, make sure that:
   - For Critical Events, the task log retention period for Application launch denied events exceeds the planned period for running the task in Statistics only mode (the default value is 30 days).
   - For events with an importance level of Warning, the task log retention period for Statistics only mode: application launch denied events exceeds the planned period for running the task in Statistics only mode (the default value is 30 days).

When the retention period for events elapses, information about the logged events is deleted and is not reflected in the report file. Before running the Applications Launch Control task in Statistics only mode, make sure that the task run time does not exceed the configured period for the specified events.

4. When the task has finished, export the logged events to a TXT file:
   a. In the workspace of the Administration Server node in Kaspersky Security Center, select the Events tab.
   b. Click the Create a selection button to create a selection of events based on the Blocked criterion to view the applications whose start will be blocked by the Applications Launch Control task.
   c. In the details pane of the selection, click Export events to file list to save the blocked application starts report to a TXT file.

Before importing and applying the generated report in a policy, make sure that the report only contains data on the applications whose start you want to allow.

5. Import data on blocked application starts into the Applications Launch Control task. To do so, in the policy properties in the Applications Launch Control task settings:
   a. On the General tab, click the Rules list button.
      The Applications Launch Control rules window opens.
   b. Click the Add button and, in the button’s context menu, select Import data of blocked applications from Kaspersky Security Center report.
   c. Select the principle for adding rules from the list created based on a Kaspersky Security Center report to the list of previously configured Applications Launch Control rules:
      - Add to existing rules if you want to add the imported rules to the list of existing rules. Rules with identical settings are duplicated.
      - Replace existing rules if you want to replace the existing rules with the imported rules.
      - Merge with existing rules if you want to add the imported rules to the list of existing rules. Rules with identical settings are not added; the rule is added if at least one rule parameter is unique.
d. In the standard Microsoft Windows window that opens, select the TXT file to which events from the blocked application launch report have been exported.

e. Click OK in the Applications Launch Control rules and in the Task settings window.

Rules created based on the Kaspersky Security Center report on blocked applications are added to the list of Applications Launch Control rules.

Importing Applications Launch Control rules from an XML file

You can import reports generated by the Rule Generator for Applications Launch Control group task and apply them as a list of allowing rules in the policy you are configuring.

When the Rule Generator for Applications Launch Control group task finishes, the application exports the created allowing rules into XML files saved in the specified shared folder. Each file with a rule list is created by analyzing files executed and applications launched on each separate server on the corporate network. The lists contain allowing rules for files and applications whose type matches the type specified in the Rule Generator for Applications Launch Control group task.

▶ To specify Applications Launch Control allowing rules for a group of servers based on an automatically generated list of allowing rules:

1. On the Tasks tab in the control panel of the group of servers you are configuring, create a Rule Generator for Applications Launch Control group task or select an existing task (see Section "Opening the Rule Generator for Applications Launch Control task wizard and properties" on page 354).

2. In the properties of the created Rule Generator for Applications Launch Control group task or in the task wizard, specify the following settings:
   - In the Notification section, configure the settings for saving the task execution report.
     
     For detailed instructions on configuring settings in this section, see the Kaspersky Security Center Help.
   - In the Settings section, specify the types of applications whose start will be allowed by the rules that are created. You can edit the set of folders containing allowed applications: exclude default folders from the task scope or add new folders manually.
   - In the Options section, specify the operations to be performed by the task while it is running and after it is finished. Specify the rule-generating criterion and the name of the file to which the generated rules will be exported.
   - In the Schedule section, configure the task start schedule settings.
   - In the Account section, specify the user account under which the task will be executed.
   - In the Exclusions from task scope section, specify the groups of servers to be excluded from the task scope.

Kaspersky Security for Windows Server does not create allowing rules for applications launched on excluded servers.
3. On the **Tasks** tab on the control panel of the group of servers being configured, in the list of group tasks select the Rule Generator for Applications Launch Control task that you have created, and click the **Start** button to start the task.

When the task is finished, the automatically generated lists of allowing rules are saved in XML files in a shared folder.

Before using the Applications Launch Control task in the network, make sure that all protected servers have access to a shared folder. If the organization’s policy does not provide for the use of a shared folder in the network, we recommend that you start the Rule Generator for Applications Launch Control task on a server in the test servers group or on a reference machine.

4. To add the generated lists of allowing rules to the Applications Launch Control task:
   a. Open the **Applications Launch Control rules** window (see Section "Opening the Applications Launch Control rules list" on page 353).
   b. Click the **Add** button and in the list that opens select **Import rules from XML file**.
   c. Select the principle for adding the automatically generated allowing rules to the list of previously created Applications Launch Control rules:
      - **Add to existing rules** if you want to add the imported rules to the list of existing rules. Rules with identical settings are duplicated.
      - **Replace existing rules** if you want to replace the existing rules with the imported rules.
      - **Merge with existing rules** if you want to add the imported rules to the list of existing rules. Rules with identical settings are not added; the rule is added if at least one rule parameter is unique.
   d. In the standard Microsoft Windows window that opens, select XML files created after completion of the Rule Generator for Applications Launch Control group task.
   e. Click **OK** in the **Applications Launch Control rules** and in the **Task settings** window.

5. If you want to apply the created rules to control the launch of application, in the policy in the properties of the Applications Launch Control task, select the **Active** mode for the task.

Allowing rules automatically generated based on task runs on each separate server are applied to all network servers covered by the policy being configured. On these servers, the application will allow the launch of only those applications for which allowing rules have been created.

**Checking application launches**

Before applying the configured Applications Launch Control rules, you can test any application to determine which Applications Launch Control rules are triggered by that application.

By default, Kaspersky Security for Windows Server denies the launch of applications whose launch is not allowed by a single rule. To avoid the denial of the launch of important applications, you need to create allowing rules for them.

If the launch of an application is controlled by several rules of different types, denying rules are given priority: the launch of an application will be denied if it falls under even one denying rule.
To test Applications Launch Control rules:

1. Open the Applications Launch Control rules window (see Section "Opening the Applications Launch Control rules list" on page 353).
2. In the window that opens, click the Show rules for the file button.
The standard Microsoft Windows window opens.
3. Select the file whose start control you want to test.
The path to the specified file is displayed in the search field. The list contains all rules that will be triggered when the selected file is started.

Creating a Rule Generator for Applications Launch Control task

To create and configure the Rule Generator for Applications Launch Control task settings:

1. Open the Settings window in the New Task Wizard (see Section "Opening the Rule Generator for Applications Launch Control task wizard and properties" on page 354).
2. Configure the following:
   - Specify Prefix for rule names.
     This is the first part of a rule name. The second part of the name of the rule is formed from the name of the object that will be allowed to start.
     The default prefix is the name of the server on which Kaspersky Security for Windows Server is installed. You can change the prefix for names of allowing rules.
   - Configure the allowing-rules usage scope (see Section "Restricting the task usage scope" on page 391).
3. Click Next.
4. Specify the actions that must be performed by Kaspersky Security for Windows Server:
   - When generating allowing rules (see Section "Actions to perform during automatic rule generation" on page 391).
   - Upon task completion (see Section "Actions to perform upon completion of automatic rule generation" on page 393).
5. In the Schedule window, set the scheduled task start settings.
6. Click Next.
7. In the Selecting an account to run the task window, specify the account you want to use.
8. Click Next.
9. Define a task name.
10. Click **Next**.

The task name should be no longer than 100 characters and cannot contain the following symbols: "  * < > & \ : |

The **Finish task creation** window opens.

11. You can optionally run the task after the Wizard finishes by selecting the **Run task after Wizard finishes** check box.

12. Click **Finish** to finish creating the task.

*To configure an existing rule in Kaspersky Security Center,*

open the **Properties: Rule Generator for Applications Launch Control** window and adjust the settings described above.

Information about the date and time when the settings were modified, and the values of task settings before and after modification, are saved in the system audit log.

**In this section**

<table>
<thead>
<tr>
<th>Restricting the task usage scope</th>
<th>..........................................................</th>

</tr>
</tbody>
</table>

**Restricting the task usage scope**

*To restrict the scope of the Rule Generator for Applications Launch Control task:*

1. Open the **Properties: Rule Generator for Applications Launch Control** window (see Section "Opening the Rule Generator for Applications Launch Control task wizard and properties" on page 354).

2. Configure the following task settings:
   - **Create allowing rules based on running applications.**
     
     This check either box enables or disables generation of Applications Launch Control rules for applications that are already running. This option is recommended if the server has a reference set of applications based on which you want to create allowing rules.
     
     If this check box is selected, allowing rules for Applications Launch Control are generated based on running applications.
     
     If this check box is cleared, running applications are not taken into account when generating allowing rules.
     
     The check box is selected by default.
     
     This check box cannot be cleared if none of the folders are selected in the **Create allowing rules for applications from the folders** table.
• **Create allowing rules for applications from the folders.**

  You can use the table to select or specify folders for the task and the types of executable files to be taken into account when creating Applications Launch Control rules. The task will generate allowing rules for files of the selected types that are located in the specified folders.

3. Click **OK**.

   The specified settings are saved.

### Actions to perform during automatic rule generation

> To configure the actions that Kaspersky Security for Windows Server while the Rule Generator for Applications Launch Control task is running:

1. Open the **Properties: Rule Generator for Applications Launch Control** (see Section "Opening the Rule Generator for Applications Launch Control task wizard and properties" on page 354) window.

2. Open the **Options** tab.

3. In the **While generating allowing rules** section, configure the following settings:

   - **Use digital certificate**

      If this option is selected, the presence of a digital certificate is specified as a rule-triggering criterion in the settings of the newly generated allowing rules for Applications Launch Control. The application will now allow start of programs launched using files with a digital certificate. We recommend this option if you want to allow the start of any applications that are trusted in the operating system.

      This option is selected by default.

   - **Use digital certificate subject and thumbprint**

      The check box enables or disables the use of the subject and thumbprint of the file's digital certificate as a criterion for triggering the allowing rules for Applications Launch Control. Selecting this check box lets you specify stricter digital certificate verification conditions.

      If this check box is selected, the subject and thumbprint values of the digital certificate of files for which the rules are generated are set as a criterion for triggering the allowing rules for Applications Launch Control. Kaspersky Security for Windows Server will allow applications that are launched using files with the specified thumbprint and digital certificate.

      Selecting this check box highly restricts the triggering of allowing rules based on a digital certificate because a thumbprint is a unique identifier of a digital certificate and cannot be forged.

      If this check box is cleared, the existence of any digital certificate that is trusted in the operating system is set as a criterion for triggering the allowing rules for Applications Launch Control.

      This check box is active if the **Use digital certificate** option is selected.

      The check box is selected by default.
• **If the certificate is missing, use**

  This is a drop-down list that allows you to select the criterion for triggering an allowing rule for Applications Launch Control if the file used to generate the rule, has no digital certificate.

• **SHA256 hash.** The checksum of the file used to generate the rule is set as a criterion for triggering the allowing rule for Applications Launch Control. The application will allow start of programs launched using files with the specified checksum.

• **path to file.** The path to the file used to generate the rule is set as a criterion for triggering the allowing rule for Applications Launch Control. The application will now allow start of programs launched using files located in the folders specified in the **Create allowing rules for applications from the folders** table in the **Settings** section.

• **Use SHA256 hash**

  If this option is selected, the checksum of the file used to generate the rule is specified as a rule-triggering criterion in the settings of the newly generated allowing rules for Applications Launch Control. The application will allow start of programs launched using files with the specified checksum.

  We recommend this option for cases when the generated rules must achieve the highest level of security: a SHA256 checksum may be used as a unique file ID. Using a SHA256 checksum as a rule-triggering criterion restricts the rule usage scope to one file.

  This option is cleared by default.

• **Generate rules for user or group of users.**

  This is a field that displays a user or group of users. The application will control any applications run by the specified user or group of users.

  The default selection is **Everyone**.

4. Click **OK**.

The specified settings are saved.

**Actions to perform upon completion of automatic rule generation**

- To configure the actions to be taken by Kaspersky Security for Windows Server after the Rule Generator for Applications Launch Control task is finished:

1. Open the **Properties: Rule Generator for Applications Launch Control** window (see Section “Opening the Rule Generator for Applications Launch Control task wizard and properties” on page 354).

2. Open the **Options** tab.

3. In the **After task completes** section, configure the following settings:

   • **Add allowing rules to the list of Applications Launch Control rules.**

     The check box enables or disables adding the newly generated allowing rules to the list of Applications Launch Control rules. The list of Applications Launch Control rules is displayed when you click the **Applications Launch Control rules** link in the details pane of the Applications Launch Control node.

     If this check box is selected, Kaspersky Security for Windows Server adds the rules generated by the Rule Generator for Applications Launch Control task to the list of Applications Launch Control rules based on the selected principle for adding rules.
If this check box is cleared, Kaspersky Security for Windows Server does not add the newly generated allowing rules to the list of Applications Launch Control rules. The generated rules are only exported to a file.

The check box is selected by default.

- **Principle of adding.**

  This drop-down list is used to specify the method used to add the newly generated allowing rules to the list of Applications Launch Control rules.

  - **Add to existing rules.** The rules are added to the list of existing rules. Rules with identical settings are duplicated.
  
  - **Replace existing rules.** The rules replace the existing rules in the list.
  
  - **Merge with existing rules.** The rules are added to the list of existing rules. Rules with identical settings are not added; the rule is added if at least one rule parameter is unique.

  By default, the **Merge with existing rules** method is selected.

- **Export allowing rules to file.**

- **Add computer details to file name.**

  The check box enables or disables adding information about the protected server to the name of the file to which the allowing rules for Device Control will be exported.

  If this check box is selected, the application adds the protected server name and the file creation date and time to the name of the export file.

  If the check box is cleared, the application does not add information about the protected server to the name of the export file.

  The check box is selected by default.

4. Click OK.

The specified settings are saved.

---

**Using a profile to configure Applications Launch Control tasks in a Kaspersky Security Center policy**

Applications Launch Control rules configured in a policy are applied to all servers within an administration group. If one administration group includes various types of servers, custom lists of rules may be required for Applications Launch Control on each server. You can use policy profiles to apply different policies to servers within a single administration group.

We recommend that you apply policy profiles to set Applications Launch Control rules for different server types within a single administration group governed by a single policy. This lets you optimize server protection, because the specified rules cover only those applications that are typically launched on a specific type of server.

Policy profiles are applied to servers of the administration group according to the tags assigned to them. You can configure a policy profile for all administration group servers that have the same tag.

---

Detailed information on tags and policy profiles, as well as instructions on how to use them, are provided in the Kaspersky Security Center Help.
To apply a policy profile in the Applications Launch Control task:

1. In the Kaspersky Security Center Administration Console tree, expand the Managed devices node. Expand the administration group for which you want to configure the application of policy profiles.

2. Assign tags based on server type to each server within the administration group:
   a. In the details pane of the selected administration group, open the Devices tab.
   b. Select the server to which you want to assign tags.
   c. In the Properties: <Server name> window of the selected server, select the Tags section and create a list of tags.
   d. Click OK.

3. Create a policy profile:
   a. In the details pane of the selected administration group, open the Policies tab.
   b. Select the policy for which you want to configure the application of profiles.
   c. In the Properties: <Policy name> window of the selected policy, open the Policy profiles section and click the Add button to create a new profile.
      The Properties: <Profile name> window opens.

4. Configure the profile settings for protecting servers within the administration group:
   a. In the Activation rules section, configure the scope of the profile and specify the conditions under which the profile will be activated.
   b. In the Applications Launch Control section, configure the lists of Applications Launch Control rules for the profile you are editing.
   c. Click OK.

5. In the Properties: <Policy name> window, click OK.

The configured profile will be applied in the policy for the Applications Launch Control task.
Managing Applications Launch Control via the Application Console

Opening the Applications Launch Control task settings

► To open the Applications Launch Control general task settings via the Application Console:

1. In the Application Console tree, expand the Server Control node.
2. Select the Applications Launch Control child node.
3. In the details pane of the Applications Launch Control child node, click the Properties link.
   The Task settings window opens.

Opening the Applications Launch Control rules window

► To open the Applications Launch Control rule list via the Application Console:

1. In the Application Console tree, expand the Server Control node.
2. Select the Applications Launch Control child node.
3. In the details pane of the Applications Launch Control node, click the Applications Launch Control rules link.

   The Applications Launch Control rules window opens.

4. Configure the rules list as required.

Opening the Rule Generator for Applications Launch Control task settings

   To configure the Rule Generator for Applications Launch Control task:

1. In the Application Console tree, expand the Automated rule generators node.

2. Select the Rule Generator for Applications Launch Control child node.

3. In the details pane of the Rule Generator for Applications Launch Control child node, click the Properties link.

   The Task settings window opens.

4. Configure the task as required.

Configuring Applications Launch Control task settings

   To configure general Applications Launch Control task settings:

1. Open the Task settings window (see Section "Opening the Applications Launch Control task settings" on page 376).

2. Configure the following task settings:

   - On the General tab:
     - Applications Launch Control task mode (see Section "Selecting the mode of the Applications Launch Control task" on page 378).
     - Rule usage scope in the task (see Section "Configuring the scope of the Applications Launch Control task" on page 379).
     - KSN Usage (see Section "Configuring KSN usage" on page 380).
     - Software Distribution Control settings (see Section "Software Distribution Control" on page 381) on the Software Distribution Control tab.
     - Task start schedule settings (see Section "Configuring the task start schedule settings" on page 153) on the Schedule and Advanced tabs.

3. Click OK in the Task settings window.

   The modified settings are saved.

Kaspersky Security for Windows Server immediately applies the new settings to the running task. Information about the date and time when the settings were modified, and the values of task settings before and after modification, are saved in the system audit log.
In this section

Selecting the mode of the Applications Launch Control task ................................................................. 378
Configuring the scope of the Applications Launch Control task ............................................................... 379
Configuring KSN usage ............................................................................................................................. 380
Software Distribution Control .................................................................................................................... 381

Selecting the mode of the Applications Launch Control task

► *To configure the mode of the Applications Launch Control task:*

1. Open the **Task settings** (see Section "Opening the Applications Launch Control task settings" on page 376) window.

2. On the **General** tab, in the **Task mode** drop-down list, specify the task mode.
   
   In this drop-down list you can select an Applications Launch Control task mode:

   * **Active.** Kaspersky Security for Windows Server uses the specified rules to control any applications that are launched.
   
   * **Statistics only.** Kaspersky Security for Windows Server does not use the specified rules to control application launches. Instead, it simply records information about those launches in the task log. All programs are allowed to start. You can use this mode to generate a list of Applications Launch Control rules based on the information recorded in the task log.

   By default, the Applications Launch Control task runs in **Statistics only** mode.

3. Clear or select the **Repeat action taken for the first file launch on all the subsequent launches for this file** check box.

   The check box enables or disables launch control for the second and subsequent attempts to start applications based on the event information stored in the cache.

   If the check box is selected, Kaspersky Security for Windows Server allows or denies subsequent launches of an application based on the task’s conclusion regarding the first launch of the application. For example, if the first application launch was allowed by the rules, information about this decision will be stored in the cache, and the second and all subsequent launches will also be allowed without rechecking.

   If the check box is cleared, Kaspersky Security for Windows Server analyzes an application every time a launch is attempted.

   The check box is selected by default.

---

Kaspersky Security for Windows Server creates a new list of cached events every time the Applications Launch Control task settings are modified. This means that Applications Launch Control is performed according to the current security settings.
4. Clear or select the **Deny the command line interpreters launch with no command to execute.**

If the check box is selected, Kaspersky Security for Windows Server denies the launch of command line interpreters even if launching interpreters is allowed. A command interpreter can only be launched with no command if both of the following conditions are met:

- Launch of the command line interpreter is allowed.
- The command to be executed is allowed.

If the check box is cleared, Kaspersky Security for Windows Server only considers allowing rules when launching a command line interpreter. The launch is denied if no allowing rule applies or the executable process is not trusted by KSN. If an allowing rule applies or the process is trusted by KSN, a command line interpreter can be launched with or without a command to execute.

Kaspersky Security for Windows Server recognizes the following command line interpreters:

- cmd.exe
- powershell.exe
- python.exe
- perl.exe

The check box is cleared by default.

5. Click **OK**.

The specified settings are saved.

All attempts to start applications are recorded in the task log.

### Configuring the scope of the Applications Launch Control task

**To define the scope of the Applications Launch Control task:**

1. Open the **Task settings** (see Section "Opening the Applications Launch Control task settings" on page 376) window.

2. On the **General** tab, in the **Rules usage scope** section, specify the following settings:

   - **Apply rules to executable files**
     
     The check box either enables or disables launch control of executable files.

     If this check box is selected, Kaspersky Security for Windows Server allows or blocks start of executable files using the specified rules whose settings specify **Executable files** as the scope.

     If the check box is cleared, Kaspersky Security for Windows Server does not control start of executable files using the specified rules. Startup of executable files is allowed.

     The check box is selected by default.
- **Monitor loading of DLL modules**
  The check box either enables or disables control of loading of DLL modules.
  
  If this check box is selected, Kaspersky Security for Windows Server allows or blocks loading of DLL modules using the specified rules whose settings specify **Executable files** as the scope.
  
  If this check box is cleared, Kaspersky Security for Windows Server does not control loading of DLL modules using the specified rules. Loading of DLL modules is allowed.
  
  The check box is active if the **Apply rules to executable files** check box is selected.
  
  The check box is cleared by default.

  Controlling loading of DLL modules may affect the performance of the operating system.

- **Apply rules to scripts and MSI packages**
  The check box either enables or disables launch of scripts and MSI packages.
  
  If this check box is selected, Kaspersky Security for Windows Server allows or blocks start of scripts and MSI packages using the specified rules whose settings specify Scripts and MSI packages as the scope.
  
  If the check box is cleared, Kaspersky Security for Windows Server does not control start of scripts and MSI packages using specified rules. Start of scripts and MSI packages is allowed.
  
  The check box is selected by default.

3. Click **OK**.

The specified settings are saved.

### Configuring KSN usage

► To configure the use of KSN services for the Applications Launch Control task:

1. Open the **Task settings** (see Section "Opening the Applications Launch Control task settings" on page 376) window.

2. On the **General** tab, in the **KSN Usage** section, specify the settings for use of KSN services:

   - If necessary, select the **Deny applications untrusted by KSN** check box.

     The check box either enables or disables Applications Launch Control according to application reputation data in KSN.

     If this check box is selected, Kaspersky Security for Windows Server blocks any application from running if it is not trusted in KSN. Applications Launch Control allowing rules that apply to applications not trusted in KSN will not be triggered. Selecting the check box provides additional protection from malware.

     If the check box is cleared, Kaspersky Security for Windows Server does not consider the reputation of applications not trusted in KSN and allows or blocks start in accordance with the rules that apply to such applications.

     The check box is cleared by default.
• If necessary, select the **Allow applications trusted by KSN** check box.

  The check box either enables or disables Applications Launch Control according to application reputation data in KSN.

  If this check box is selected, Kaspersky Security for Windows Server allows applications to run if they are trusted in KSN. Denying application launch control rules that apply to KSN-trusted applications have higher priority: if an application is trusted by KSN services, the application launch will be denied.

  If the check box is cleared, Kaspersky Security for Windows Server does not consider the reputation of KSN-trusted applications and allows or denies launch in accordance with rules that apply to such applications.

  The check box is cleared by default.

• If the **Allow applications trusted by KSN** check box is selected, indicate the users and/or groups of users allowed to start applications trusted in KSN. To do this, perform the following actions:
  
a. Click the **Edit** button.

  The standard Microsoft Windows **Select users or groups** window opens.

  b. Specify the list of users and/or user groups.

  c. Click **OK**.

3. Click **OK** in the **Task settings** window.

   The specified settings are saved.

---

**Software Distribution Control**

► **To add a trusted distribution package:**

1. Open the **Task settings** (see Section "Opening the Applications Launch Control task settings" on page 376) window.

2. On the **Software Distribution Control** tab, select the **Automatically allow software distribution for applications and packages listed** check box.

   The check box enables and disables automatic creation of exclusions for all files started using the distribution packages specified in the list.

   If the check box is selected, the application automatically allows files in the trusted distribution packages to start. The list of applications and distribution packages allowed to start can be edited.

   If the check box is cleared, the application does not apply the exclusions specified in the list.

   The check box is cleared by default.

---

You can select the **Automatically allow software distribution for applications and packages listed**, if the **Apply rules to executable files** check box in the **General** tab is selected in the **Applications Launch Control** task settings.
3. Clear the **Always allow software distribution via Windows Installer** check box if required.

   The check box enables and disables automatic creation of exclusions for all files executed via Windows Installer.

   If the check box is selected, files installed via Windows Installer will always be allowed to start.

   If the check box is cleared, files will not be allowed to start unconditionally, even if they are started via Windows Installer.

   The check box is selected by default.

   The check box is not editable if the **Automatically allow software distribution for applications and packages listed** check box is not selected.

   Clearing the **Always allow software distribution via Windows Installer** check box is only recommended if it is absolutely necessary. Turning off this function may cause issues with updating operating system files and also prevent the launch of files extracted from a distribution package.

4. If required, select the **Always allow software distribution via SCCM using the Background Intelligent Transfer Service** check box.

   The check box turns on or off automatic software distribution using the System Center Configuration Manager.

   If the check box is selected, Kaspersky Security for Windows Server automatically allows Microsoft Windows deployment using the System Center Configuration Manager. The application allows software distribution only via the Background Intelligent Transfer Service.

   The application controls start of objects with the following extensions:
   - .exe
   - .msi

   The check box is cleared by default.

   The application controls the software distribution cycle on the server — from package delivery to installation or update. The application does not control processes if any stage of distribution was performed before installation of the application on the server.

5. To edit the list of trusted distribution packages, click **Change packages list** and select one of the following methods in the window that opens:

   - **Add one distribution package**.
     a. Click the **Browse** button and select the executable file or distribution package.

     The **Trust criteria** section is automatically populated with data about the selected file.
     b. Clear or select the **Allow launching to all files from this distribution package extraction chain** check box.
c. Select one of two available options for criteria to use to determine whether a file or distribution package is trusted:

- **Use digital certificate**
  
  If this option is selected, the presence of a digital certificate is specified as a rule-triggering criterion in the settings of the newly generated allowing rules for Applications Launch Control. The application will now allow start of programs launched using files with a digital certificate. We recommend this option if you want to allow the start of any applications that are trusted in the operating system.
  
  This option is selected by default.

- **Use SHA256 hash**
  
  If this option is selected, the checksum of the file used to generate the rule is specified as a rule-triggering criterion in the settings of the newly generated allowing rules for Applications Launch Control. The application will allow start of programs launched using files with the specified checksum.
  
  We recommend this option for cases when the generated rules must achieve the highest level of security: a SHA256 checksum may be used as a unique file ID. Using a SHA256 checksum as a rule-triggering criterion restricts the rule usage scope to one file.
  
  This option is cleared by default.

- **Add several packages by hash**.

  You can select an unlimited number of executable files and distribution packages, and add them to the list all at the same time. Kaspersky Security for Windows Server examines the hash and allows the operating system to launch the specified files.

- **Change selected package**.

  Use this option to select a different executable file or distribution package, or to change the trust criteria.

- **Import distribution packages list from file**.

  You can import the list of trusted distribution packages from a configuration file. To be recognized by Kaspersky Security for Windows Server, such a file must satisfy the following parameters:

  - The file extension is TXT.
  - The file contains information structured as a list of lines, where each line includes data for one of the trusted files.
  - The file must contain a list in one of the following formats:
    - `<file name>:<SHA256 hash>`.
    - `<SHA256 hash>`<file name>.

  In the **Open** window, specify the configuration file containing a list of trusted distribution packages.
6. If you want to remove a previously added application or distribution package for the trusted list, click the **Delete distribution packages** button. Extracted files will be allowed to run.

   To prevent extracted files from starting, uninstall the application on the protected server or create a denying rule in the Applications Launch Control task settings.

7. Click **OK**.

   Your newly configured settings are saved.

### Configuring Applications Launch Control rules

Learn how to generate, import and export a list of rules, or manually create allowing or denying rules using the Application Launch Control task.

#### Adding an Applications Launch Control rule

*To add an Applications Launch Control rule, take the following steps:*

1. Open the **Applications Launch Control rules** window.
2. Click the **Add** button.
3. In the context menu of the button, select **Add one rule**.

   The **Rule settings** window opens.

4. Specify the following settings:
   a. In the **Name** field, enter the name of the rule.
   b. In the **Type** drop-down list, select the rule type:
      - **Allowing** if you want the rule to allow launch of applications in accordance with the criteria specified in the rule settings.
      - **Denying** if you want the rule to block launch of applications in accordance with the criteria specified in the rule settings.
c. In the Scope drop-down list, select the type of files whose execution will be controlled by the rule:
   - **Executable files** if you want the rule to control launch of executable files.
   - **Scripts and MSI packages** if you want the rule to control launch of scripts and MSI packages.

d. In the User or user group field, specify the users who will be allowed or not allowed to start programs based on the type of rule. To do this, perform the following actions:
   i. Click the **Browse** button.
   ii. The standard Microsoft Windows **Select user or groups** window opens.
   iii. Specify the list of users and/or user groups.
   iv. Click **OK**.

e. If you want to take the values of the rule-triggering criteria listed in the **Rule triggering criterion** section from a specific file:
   i. Click the **Set rule triggering criterion from file properties** button.
      The standard Microsoft Windows **Open** window opens.
   ii. Select the file.
   iii. Click the **Open** button.
      The criteria values in the file are displayed in the fields in the **Rule triggering criterion** section. The criterion for which data are available in the file properties is selected by default.

f. In the **Rule triggering criterion** section, select one of the following options:
   - **Digital certificate** if you want the rule to control the start of applications launched using files signed with a digital certificate:
     - Select the **Use subject** check box if you want the rule to control the launch of files signed with a digital certificate only with the specified header.
     - Select the **Use thumb** check box if you want the rule to only control the launch of files signed with a digital certificate with the specified thumbprint.
   - **SHA256 hash** if you want the rule to control the start of programs launched using files whose checksum matches the one specified.
   - **Path to file** if you want the rule to control the start of programs launched using files located at the specified path.

   Kaspersky Security for Windows Server does not recognize paths that contain slashes ("/"). Use backslash ("\") to enter the path correctly.

   g. If you want to add rule exclusions:
   i. In the **Exclusions from rule** section, click the **Add** button.
      The **Exclusion from rule** window opens.
   ii. In the **Name** field, enter the name of the exclusion.
iii. Specify the settings for exclusion of application files from the Applications Launch Control rule. You can fill out the settings fields from the file properties by clicking the **Set exclusion based on file properties** button.

- **Digital certificate**
  
  If this option is selected, the presence of a digital certificate is specified as a rule-triggering criterion in the settings of the newly generated allowing rules for Applications Launch Control. The application will now allow start of programs launched using files with a digital certificate. We recommend this option if you want to allow the start of any applications that are trusted in the operating system.

  This option is selected by default.

- **Use subject**
  
  The check box either enables or disables the use of the subject of the digital certificate as a rule-triggering criterion.

  If the check box is selected, the specified digital certificate subject is used as a rule-triggering criterion. The created rule will control the start of applications only for the vendor specified in the subject.

  If the check box is cleared, the application will not use the subject of the digital certificate as a rule-triggering criterion. If the **Digital certificate** criterion is selected, the created rule will control the start of applications signed with a digital certificate containing any subject.

  The subject of the digital certificate used to sign the file can be specified only from the properties of the selected file using the **Set rule triggering criterion from file properties** button located above the **Rule triggering criterion** section.

  The check box is cleared by default.

- **Use thumb**
  
  The check box enables / disables the use of the thumbprint of the digital certificate as a rule-triggering criterion.

  If the check box is selected, the specified digital certificate thumbprint is used as a rule-triggering criterion. The created rule will control the start of applications signed with a digital certificate with the specified thumbprint.

  If the check box is cleared, the application will not use the thumbprint of the digital certificate as a rule-triggering criterion. If the **Digital certificate** criterion is selected, the application will control the start of applications signed with a digital certificate with any thumbprint.

  The thumbprint of the digital certificate used to sign the file can be specified only from the properties of the selected file using the **Set rule triggering criterion from file properties** button located above the **Rule triggering criterion** section.

  The check box is cleared by default.

- **SHA256 hash**
  
  If this option is selected, the checksum of the file used to generate the rule is specified as a rule-triggering criterion in the settings of the newly generated allowing rules for Applications Launch Control. The application will allow start of programs launched using files with the specified checksum.
We recommend this option for cases when the generated rules must achieve the highest level of security: a SHA256 checksum may be used as a unique file ID. Using a SHA256 checksum as a rule-trIGGERing criterion restricts the rule usage scope to one file.

This option is cleared by default.

- **Path to file**
  - If the check box is selected, Kaspersky Security for Windows Server uses the full path to the file to determine whether the process is trusted.
  - If the check box is cleared, the path to the file is not used to determine whether the process is trusted.

  The check box is cleared by default.

iv. Click OK.

v. If necessary, repeat steps (i)-(iv) to add additional exclusions.

5. Click OK in the **Rule settings** window.

The created rule is displayed in the list in the **Applications Launch Control rules** window.

### Enabling the Default Allow mode

Default Allow mode allows all applications to start if they are not blocked by rules or by a conclusion from KSN that they are not trusted. Default Allow mode can be enabled by adding specific allowing rules. You can enable Default Allow for only scripts or for all executable files.

**To add a Default Allow rule:**

1. Open the **Applications Launch Control rules** window.
2. Click the **Add** button.
3. In the context menu of the button, select **Add one rule**.
   - The **Rule settings** window opens.
4. In the **Name** field, enter the name of the rule.
5. In the **Type** drop-down list, select the **Allowing** rule type.
6. In the **Scope** drop-down list, select the type of files whose execution will be controlled by the rule:
   - **Executable files** if you want the rule to control the launch of executable files.
   - **Scripts and MSI packages** if you want the rule to control the launch of scripts and MSI packages.
7. In the **Rule triggering criterion** section, select the **Path to file** option.
8. Enter the following mask: `?:\`
9. Click OK in the **Rule settings** window.

Kaspersky Security for Windows Server applies the Default Allow mode.
Creating allowing rules from Applications Launch Control task events

To create a configuration file that contains allowing rules generated from Applications Launch Control task events:

1. Start the Applications Launch Control task in **Statistics only** mode (see Section “Selecting the mode of the Applications Launch Control task” on page 378) to record information about all applications launches on a protected server in the task log.

2. After the task finishes running in **Statistics only** mode, open the task log by clicking the **Open task log** button in the **Management** section of the Applications Launch Control node’s detail pane.

3. In the **Logs** window, click **Generate rules based on events**.

Kaspersky Security for Windows Server will generate an XML configuration file containing a rule list based on events of the Applications Launch Control task in **Statistics only** mode. You can apply this rule list (see Section “Importing Applications Launch Control rules from an XML file” on page 389) in the Applications Launch Control task.

Before applying the rule list generated from the logged task events, we recommend that you review and manually process the list to be certain that the launch of critical files (for example, system files) is allowed by the specified rules.

All task events are recorded in the task log regardless of the task mode. You can generate a configuration file with a rule list based on the log created while the task is running in **Active** mode. This scenario is not recommended except for urgent cases, because a final rule list must be generated before the task is run in **Active** mode in order to make it efficient.

Exporting Applications Launch Control rules

To export Applications Launch Control rules to a configuration file:

1. Open the **Applications Launch Control rules** window.

2. Click the **Export to a file** button.

   The standard Microsoft Windows window opens.

3. In the window that opens, specify the file to which you want to export the rules. If no such file exists, it will be created. If a file with the specified name already exists, its contents will be overwritten when the rules are exported.

4. Click the **Save** button.

   The rule settings will be exported to the specified file.
Importing Applications Launch Control rules from an XML file

To import Applications Launch Control rules:

1. Open the Applications Launch Control rules window.
2. Click the Add button.
3. In the context menu of the button, select Import rules from XML file.
4. Specify the method for adding the imported rules. To do so, select one of the options from the context menu of the Import rules from XML file button:
   - Add to existing rules if you want to add the imported rules to the list of existing rules. Rules with identical settings are duplicated.
   - Replace existing rules if you want to replace the existing rules with the imported rules.
   - Merge with existing rules if you want to add the imported rules to the list of existing rules. Rules with identical settings are not added; the rule is added if at least one rule parameter is unique.

   The standard Microsoft Windows Open window opens.
5. In the Open window, select the XML file that contains the Applications Launch Control rules.
6. Click the Open button.

   The imported rules will be displayed in the list in the Applications Launch Control rules window.

Removing Applications Launch Control rules

To remove Applications Launch Control rules:

1. Open the Applications Launch Control rules window.
2. In the list, select one or more rules that you want to delete.
3. Click the Remove Selected button.
4. Click the Save button.

   The selected Applications Launch Control rules are deleted.
Configuring a Rule Generator for Applications Launch Control task

To configure the Rule Generator for Applications Launch Control task settings:

1. Open the Task settings (see Section "Opening the Rule Generator for Applications Launch Control task settings" on page 377) window of the Rule Generator for Applications Launch Control task.

2. Configure the following settings:
   - On the General tab:
     - Specify Prefix for rule names.
       This is the first part of a rule name. The second part of the name of the rule is formed from the name of the object that will be allowed to start.
       The default prefix is the name of the server on which Kaspersky Security for Windows Server is installed. You can change the prefix for names of allowing rules.
     - Configure the allowing-rules usage scope (see Section "Restricting the task usage scope" on page 391).
   - On the Action tab, specify the actions that must be performed by Kaspersky Security for Windows Server:
     - When generating allowing rules (see Section "Actions to perform during automatic rule generation" on page 391).
     - Upon task completion (see Section "Actions to perform upon completion of automatic rule generation" on page 393).
   - On the Schedule and Advanced tabs, configure Schedule task start settings (see Section "Configuring the task start schedule settings" on page 153).
   - On the Run as tab, configure Task start settings with account permission (see Section "Specifying a user account to start a task" on page 155).

3. Click OK.

Kaspersky Security for Windows Server immediately applies the new settings to the running task. Information about the date and time when the settings were modified, and the values of task settings before and after modification.

In this section

Restricting the task usage scope........................................................................................................................................... 391
Actions to perform during automatic rule generation........................................................................................................ 391
Actions to perform upon completion of automatic rule generation..................................................................................... 393
Restricting the task usage scope

To restrict the scope of the Rule Generator for Applications Launch Control task:

1. Open the Task settings (see Section "Opening the Rule Generator for Applications Launch Control task settings" on page 377) window of the Rule Generator for Applications Launch Control task.

2. Configure the following task settings:
   - Create allowing rules based on running applications.
     This check either box enables or disables generation of Applications Launch Control rules for applications that are already running. This option is recommended if the server has a reference set of applications based on which you want to create allowing rules.
     If this check box is selected, allowing rules for Applications Launch Control are generated based on running applications.
     If this check box is cleared, running applications are not taken into account when generating allowing rules.
     The check box is selected by default.
     This check box cannot be cleared if none of the folders are selected in the Create allowing rules for applications from the folders table.
   - Create allowing rules for applications from the folders.
     You can use the table to select or specify folders for the task and the types of executable files to be taken into account when creating Applications Launch Control rules. The task will generate allowing rules for files of the selected types that are located in the specified folders.

3. Click OK.
   The specified settings are saved.

Actions to perform during automatic rule generation

To configure the actions that Kaspersky Security for Windows Server while the Rule Generator for Applications Launch Control task is running:

1. Open the Task settings (see Section "Opening the Rule Generator for Applications Launch Control task settings" on page 377) window of the Rule Generator for Applications Launch Control task.

2. Open the Options tab.

3. In the While generating allowing rules section, configure the following settings:
   - Use digital certificate
     If this option is selected, the presence of a digital certificate is specified as a rule-trigerring criterion in the settings of the newly generated allowing rules for Applications Launch Control. The application will now allow start of programs launched using files with a digital certificate. We recommend this option if you want to allow the start of any applications that are trusted in the operating system.
     This option is selected by default.
• **Use digital certificate subject and thumbprint**

The check box enables or disables the use of the subject and thumbprint of the file's digital certificate as a criterion for triggering the allowing rules for Applications Launch Control. Selecting this check box lets you specify stricter digital certificate verification conditions.

If this check box is selected, the subject and thumbprint values of the digital certificate of files for which the rules are generated are set as a criterion for triggering the allowing rules for Applications Launch Control. Kaspersky Security for Windows Server will allow applications that are launched using files with the specified thumbprint and digital certificate.

Selecting this check box highly restricts the triggering of allowing rules based on a digital certificate because a thumbprint is a unique identifier of a digital certificate and cannot be forged.

If this check box is cleared, the existence of any digital certificate that is trusted in the operating system is set as a criterion for triggering the allowing rules for Applications Launch Control.

This check box is active if the **Use digital certificate** option is selected.

The check box is selected by default.

• **If the certificate is missing, use**

  This is a drop-down list that allows you to select the criterion for triggering an allowing rule for Applications Launch Control if the file used to generate the rule, has no digital certificate.

  • **SHA256 hash.** The checksum of the file used to generate the rule is set as a criterion for triggering the allowing rule for Applications Launch Control. The application will allow start of programs launched using files with the specified checksum.

  • **path to file.** The path to the file used to generate the rule is set as a criterion for triggering the allowing rule for Applications Launch Control. The application will now allow start of programs launched using files located in the folders specified in the Create allowing rules for applications from the folders table in the **Settings** section.

• **Use SHA256 hash**

  If this option is selected, the checksum of the file used to generate the rule is specified as a rule-triggering criterion in the settings of the newly generated allowing rules for Applications Launch Control. The application will allow start of programs launched using files with the specified checksum.

  We recommend this option for cases when the generated rules must achieve the highest level of security: a SHA256 checksum may be used as a unique file ID. Using a SHA256 checksum as a rule-triggering criterion restricts the rule usage scope to one file.

  This option is cleared by default.

• **Generate rules for user or group of users.**

  This is a field that displays a user or group of users. The application will control any applications run by the specified user or group of users.

  The default selection is **Everyone**.

4. Click **OK**.

The specified settings are saved.
Actions to perform upon completion of automatic rule generation

► To configure the actions to be taken by Kaspersky Security for Windows Server after the Rule Generator for Applications Launch Control task is finished:

1. Open the Task settings (see Section "Opening the Rule Generator for Applications Launch Control task settings" on page 377) window of the Rule Generator for Applications Launch Control task.
2. Open the Options tab.
3. In the After task completes section, configure the following settings:
   - Add allowing rules to the list of Applications Launch Control rules.
     The check box enables or disables adding the newly generated allowing rules to the list of Applications Launch Control rules. The list of Applications Launch Control rules is displayed when you click the Applications Launch Control rules link in the details pane of the Applications Launch Control node.
     If this check box is selected, Kaspersky Security for Windows Server adds the rules generated by the Rule Generator for Applications Launch Control task to the list of Applications Launch Control rules based on the selected principle for adding rules.
     If this check box is cleared, Kaspersky Security for Windows Server does not add the newly generated allowing rules to the list of Applications Launch Control rules. The generated rules are only exported to a file.
     The check box is selected by default.
   - Principle of adding.
     This drop-down list is used to specify the method used to add the newly generated allowing rules to the list of Applications Launch Control rules.
     • Add to existing rules. The rules are added to the list of existing rules. Rules with identical settings are duplicated.
     • Replace existing rules. The rules replace the existing rules in the list.
     • Merge with existing rules. The rules are added to the list of existing rules.
       Rules with identical settings are not added; the rule is added if at least one rule parameter is unique.
     By default, the Merge with existing rules method is selected.
   - Export allowing rules to file.
   - Add computer details to file name.
     The check box enables or disables adding information about the protected server to the name of the file to which the allowing rules for Device Control will be exported.
     If this check box is selected, the application adds the protected server name and the file creation date and time to the name of the export file.
     If the check box is cleared, the application does not add information about the protected server to the name of the export file.
     The check box is selected by default.
4. Click OK.

The specified settings are saved.
Device Control

About Device Control task

Kaspersky Security for Windows Server controls registration and usage of the mass storage devices and CD/DVD drives in order to protect server against computer security threats, that may occur in process of file exchange with flash drives or other type of external device connected via USB. Mass storage device is an external device that may be connected to a server in order to copy or store files.

Kaspersky Security for Windows Server controls the following USB external devices connections:

- USB-connected flash drives
- CD/DVD ROM drives
- USB-connected floppy disk drives
- USB-connected MTP-mobile devices

Kaspersky Security for Windows Server informs you about all devices connected via USB with the corresponding event in the task and event logs. The event details include device type and connection path. When the Device Control task is started, Kaspersky Security for Windows Server checks and lists all devices connected via USB. You can configure the notifications in the Kaspersky Security Center notification settings section.

The Device Control task monitors all the attempts of external devices connections to a protected server via USB and blocks connection, if there are no allowing rules for such devices. After the connection is blocked, the device is not available.
The application prescribes one of the following statuses to each connected mass storage device:

- **Trusted.** Device for which you want to allow files exchange. Upon rules list generation, the *Device Instance Path* value is included into usage scope for at least one rule.

- **Untrusted.** Device for which you want to restrict files exchange. Device instance path is not included into any allowing rule usage scope.

You can create allowing rules for external devices to allow data exchange using the Rule Generator for Device Control task. You can also expand the usage scope for already specified rules. You cannot create allowing rules manually.

Kaspersky Security for Windows Server identifies mass storage devices that are registered in the system, by using the *Device Instance Path* value. Device Instance Path is a default feature uniquely specified for each external device. The Device Instance Path value is specified for each external device in its Windows properties and is automatically determined by Kaspersky Security for Windows Server during rule generation.

The Device Control task can operate in two modes:

- **Active.** Kaspersky Security for Windows Server applies rules to control the connection of flash drives and other external devices, and allows or blocks the use of all devices according to the Default Deny principle and specified allowing rules. The use of trusted external devices is allowed. The use of untrusted external devices is blocked by default.

If an external device you consider to be untrusted is connected to a protected server before the Device Control task is run in the Active mode, the device is not blocked by the application. We recommend that you disconnect the untrusted device manually or restart the server. Otherwise, the Default Deny principle will not be applied to the device.

- **Statistics only.** Kaspersky Security for Windows Server does not control the connection of flash drives and other external devices, but only logs information about the connection and registration of external devices on a protected server, and about the Device Control allowing rules triggered by the connected devices. The use of all external devices is allowed. This mode is set by default.

You can apply this mode for rules generation on the basis of the information about blocking logged during the task running (see Section "Filling rules list basing on Device Control task events" on page 414).

### About Device Control rules

The rules are generated uniquely for each device that is currently connected or has ever been connected to a protected server if the information about this device is stored in the system registry.

To generate allowing rules for device control, you can do the following:

- Apply the Rule Generator for Device Control task (see Section "About Rule Generator for Device Control task" on page 398).

- Run the Device Control task in the Statistics only mode (see Section "Filling rules list basing on Device Control task events" on page 414).

- Apply system information about previously connected devices (see Section "Adding an allowing rule for one or several external devices" on page 414).

- Expand the usage scope for already specified rules (see Section "Expanding Device Control rules usage scope" on page 416).
The maximum number of the Device Control rules supported by Kaspersky Security for Windows Server is 3072.

Device Control rules are described below.

**Rule type**

Rule type is always *allowing*. By default, the Device Control task blocks all flash drives and other external devices connections if these devices are not included into any allowing rule usage scope.

**Triggering criterion and rule usage scope**

Device Control rules identify flash drives and other external devices basing on *Device Instance Path*. Device instance path is a unique criterion that is assigned to a device by the system when the device is connected and is registered as a Mass Storage Device or CD/DVD drive (for example, IDE or SCSI).

Kaspersky Security for Windows Server controls connection of the CD/DVD drives regardless of the bus used for connection. When mounting such device via USB, operating system registers two path values to the device instance: for the mass storage device and for CD/DVD drive (for example, IDE or SCSI). To connect such devices correctly, allowing rules for each path value to the instance must be set.

Kaspersky Security for Windows Server automatically defines the device instance path and parses the value obtained into the following elements:

- Device manufacturer (VID)
- Device controller type (PID)
- Device serial number

You cannot set the device instance path manually. Allowing rule triggering criteria define the rule usage scope. By default, newly created rule usage scope includes one initial device, basing on whose properties Kaspersky Security for Windows Server had generated the rule. You can configure the values in the created rule settings by using a mask to expand the rule usage scope (see Section "Expanding Device Control rules usage scope" on page 416).
Initial device values
Device properties that Kaspersky Security for Windows Server used for allowing rule generation and that are displayed in Windows Device Manager for each device connected.

Initial device values contain the following information:

- **Device instance path.** Basing on this property Kaspersky Security for Windows Server defines rule triggering criteria and fills the following fields: Manufacturer (VID), Controller type (PID), Serial number in the Rule usage scope section of the Rule properties window.

- **Friendly name.** Device clear name that is set in the device properties by its manufacturer.

Kaspersky Security for Windows Server automatically defines initial device values when the rule is generating. Later on you can use these values to recognize the device that was used as a base for the rule generating. Initial device values are not available for editing.

Description
You can add additional information for each created device control rule in the Description field, for example, you can note name of the connected flash driver or define its owner. The description is displayed in a corresponding graph in the Device Control rules window.

Description and initial device values are not allowed for rule triggering and are prescribed only to simplify device identification by user.

About Device Control rules list filling
You can import device control allowing rules from the XML files that were automatically generated during the Device Control or the Rule Generator for Device Control tasks running.

By default, Kaspersky Security for Windows Server restricts connections of any flash drives and other external devices, if they are not included into the usage scope of specified device control rules.

<table>
<thead>
<tr>
<th>Rule generation scenario</th>
<th>Target</th>
</tr>
</thead>
</table>
| The Rule Generator for Device Control task | • Add allowing rules for previously connected trusted devices before the first start of the Device Control task.  
• Generate rules list for devices trusted in the protected servers network. |
| Rules generation based on system data | Add allowing rules for one or several newly connected devices. |
| The Device Control task in the Statistics only mode | Generate allowing rules for a large number of trusted devices. |

The rule Generator for Device Control task usage
XML file, generated upon the Rule Generator for Device Control task completion, contains allowing rules for those flash drives and other external devices whose data have been stored in a system registry.
During the task running, Kaspersky Security for Windows Server receives system data about all mass storage devices that have ever been connected or are currently connected to a protected server and generates allowing rules list basing on system data for detected devices. Upon task completion the application creates XML file in folder that is situated by path specified in the task settings. You can configure automatic import of the generated rules into the list of rules for the Device Control task.

This scenario is recommended to generate allowing rules list before the first start of the Device Control task, so that allowing rules generated cover all trusted external devices that are used on a protected server.

**Usage of system data about all connected devices**

During the task running, Kaspersky Security for Windows Server receives system data about all external devices that have ever been connected or that are currently connected to a protected server, and displays detected devices in the list of the Generate rules based on the system information window.

For each detected device Kaspersky Security for Windows Server parses the values of manufacturer (VID), controller type (PID), friendly name, serial number and device instance path. You can generate allowing rules for any mass storage device, whose data have been stored in the system, and straightly add newly created rules to the list of the device control rules.

This scenario is recommended to renew an already specified rules list when it is necessary to trust a little amount of new mass storage devices.

Kaspersky Security for Windows Server does not get access to system data about mobile devices connected via MTP. You cannot generate allowing rules for MTP-connected mobile devices.

**Usage of the Device Control task in the Statistics only mode**

XML file received upon the Device Control task completion in the Statistics only mode is generated basing on the task log.

During the task running Kaspersky Security for Windows Server logs information about all connections of flash drives and other mass storage devices to a protected server. You can generate allowing rules based on task events and export them to an XML file. Before starting the task in the Statistics only mode, it is recommended to configure the task running period so that during the term specified all the possible external devices connections to a protected server would be performed.

This scenario is recommended to renew an already generated rules list if it is required to allow a large number of new external devices.

If the rule list generation according to this scenario is performed on a template machine, you can apply a generated allowing rules list while configuring the Device Control task via the Kaspersky Security Center. This way you will be able to allow to use the external devices that are connected to a template machine on all the computers included into a protected network.

**About Rule Generator for Device Control task**

The Rule Generator for Device Control task can automatically create a list of allowing rules for connected flash drives and other mass storage devices basing on the system data about all external devices that have ever been connected to a protected server.
Kaspersky Security for Windows Server does not get access to system data about mobile devices connected via MTP. You cannot generate allowing rules for MTP-connected mobile devices.

Upon the task completion Kaspersky Security for Windows Server creates an XML configuration file that contains allowing rules list for all detected external devices or straightly adds generated rules in the Device Control task depending on the Rule Generator for Device Control settings. The application will subsequently allow devices for which allowing rules were automatically generated.

Generated and added in the task rules are displayed in the **Device Control rules** window.

### Device Control rules generation scenarios

You can generate rules (see Section "Generating Device Control rules for all computers via Kaspersky Security Center" on page 404) basing on Windows data about all mass storage devices that have ever been connected or are currently connected by three scenarios:

- Using the Rule Generator for Device Control group task. Use this scenario during the rule generation process to take into account all ever connected mass storage devices that are registered by the systems on all network servers.

- Using the Generate rules based on system data option. Use this scenario during the rule generation process to take into account all ever connected mass storage devices that are and registered by the system of the server with a Kaspersky Security Center Administration Console installed.

- Using the Generate rules based on connected devices in the **Device Control rules** window and the Rule Generator for Device Control task settings. Use this method if you want to consider only data about devices currently connected to the protected server when generating allowing rules.

Kaspersky Security for Windows Server does not get access to system data about mobile devices connected via MTP. You cannot generate allowing rules for trusted MTP-connected mobile devices using scenarios for rules list filling on the base of system data about all connected devices.
Device Control default task settings

By default, the Device Control task has the settings described in the table below. You can change the values of these settings.

Table 59. Default Device Control task settings

<table>
<thead>
<tr>
<th>Setting</th>
<th>Default Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Task mode</td>
<td>Statistics only</td>
<td>The task logs information about external devices that were blocked or allowed according to the specified rules. External devices are not actually blocked. You can select the Active mode for server protection to actually block the use of external devices.</td>
</tr>
<tr>
<td>Allow using all mass storage devices when the Device Control task is not running</td>
<td>Not applied</td>
<td>Kaspersky Security for Windows Server blocks use of external devices, regardless of the Device Control task state. This provides maximum protection level against computer security threats arising when exchanging files with external devices. You can adjust the setting so that Kaspersky Security for Windows Server allows use of all external devices when the Device Control task is not running.</td>
</tr>
<tr>
<td>Task start schedule</td>
<td>First run is not scheduled.</td>
<td>The Device Control task does not start automatically at the start of Kaspersky Security for Windows Server. You can configure the task start schedule.</td>
</tr>
</tbody>
</table>

Table 60. Rule Generator for Device Control task default settings

<table>
<thead>
<tr>
<th>Setting</th>
<th>Default Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Task mode</td>
<td>Consider system data about all mass storages that have ever been connected</td>
<td>You can add rules to existing ones without merging them and without deleting duplicated rules, or replace existing rules with new allowing rules, or configure export of allowing rules to a file.</td>
</tr>
<tr>
<td>Actions upon task completion</td>
<td>Allowing rules are added to the list of Device Control rules; new rules are merged with existing ones; duplicated rules are removed.</td>
<td></td>
</tr>
<tr>
<td>Task start schedule</td>
<td>First run is not scheduled.</td>
<td>The Rule Generator for Device Control task does not start automatically at startup of Kaspersky Security for Windows Server. You can start the task manually or configure a scheduled start.</td>
</tr>
</tbody>
</table>

Opening policy settings for the Device Control task

To open the Device Control task settings via the Kaspersky Security Center policy:

1. Expand the Managed devices node in the Kaspersky Security Center Administration Console tree.
2. Select the administration group for which you want to configure the task.
3. Select the Policies tab.
4. Double-click the policy name you want to configure.
5. In the Properties: <Policy name> window that opens, select the Local activity control section.
6. Click the Settings button in the Device Control subsection.
   The Device Control window opens.
7. Configure the policy as required.
Opening the Device Control rules list

To open the Device Control rules list via the Kaspersky Security Center:

1. Expand the Managed devices node in the Kaspersky Security Center Administration Console tree.
2. Select the administration group for which you want to configure the task.
3. Select the Policies tab.
4. Double-click the policy name you want to configure.
5. In the Properties: <Policy name> window that opens, select the Local activity control section.
6. Click the Settings button in the Device Control subsection.
   The Device Control window opens.
7. On the General tab, click the Rules list button.
   The Device Control rules window opens.
8. Configure the policy as required.

Opening the Rule Generator for Device Control task wizard and properties

To initialize creation of a Rule Generator for Device Control task:

1. Expand the Managed devices node in the Kaspersky Security Center Administration Console tree.
2. Select the administration group for which you want to configure the task.
3. Select the Tasks tab.
4. Click Create a task button.
   The New Task Wizard window opens.
5. Select the Rule Generator for Device Control task.
6. Click Next.
   The Settings window opens.

To configure the existing Rule Generator for Device Control task:

1. Expand the Managed devices node in the Kaspersky Security Center Administration Console tree.
2. Select the administration group for which you want to configure the task.
3. Select the Tasks tab.
4. Double-click the task name in the list of Kaspersky Security Center tasks.
   The Properties: Rule Generator for Device Control window opens.

See the Configuring the Rule Generator for Device Control task section for for details on configuring the task.
Configuring the Device Control task

To configure the Device Control task settings:

1. Open the Device Control window (see Section "Opening policy settings for the Device Control task" on page 401).

2. On the General tab, configure the following task settings:
   - In the Task mode section, select one of the task modes:
     - Active.

        Kaspersky Security for Windows Server applies rules to control the connection of flash-drives and other external devices, and allows or blocks the use of all devices according to the Default Deny principle and specified allowing rules. The use of trusted external devices is allowed. The use of untrusted external devices is blocked by default.

        If an external device you consider to be untrusted is connected to a protected server before the Device Control task is run in the Active mode, the device is not blocked by the application. We recommend that you disconnect the untrusted device manually or restart the computer. Otherwise, the Default Deny principle will not be applied to the device.

     - Statistics only.

        Kaspersky Security for Windows Server does not control the connection of flash-drives and other external devices, but only logs information about the connection and registration of external devices on a protected server, and about the Device Control allowing rules triggered by the connected devices. The use of all external devices is allowed. This mode is set by default.

     - Select or clear the Allow using all mass storage devices when the Device Control task is not running check box.

         The check box allows or blocks the use of mass storage devices when the Device Control task is not running.

         If the check box is selected and Device Control task is not running, Kaspersky Security for Windows Server allows using any mass storage devices on a protected server.

         If the check box is cleared, the application blocks the use of untrusted mass storage devices on a protected server in the following cases: the Device Control task is not running or the Kaspersky Security Service is turned off. This option is recommended to maximize the level of protection against computer security threats arising when exchanging files with external devices.

         The check box is cleared by default.

3. Click the Rules list button to edit the list of Device control rules (see Section "Configuring Device Control rules via the Kaspersky Security Center" on page 406).

4. If necessary, configure the scheduled task start settings on the Task management tab.

5. Click OK.

Kaspersky Security for Windows Server immediately applies the new settings to the running task. Information about the date and time when the settings were modified, and the values of task settings before and after modification, are saved in the task log.
Generating Device Control rules for all computers via Kaspersky Security Center

You can create lists of Device Control rules using Kaspersky Security Center tasks for all servers and groups of servers on the corporate network at once.

You can create lists of Device Control rules on the side of Kaspersky Security Center in the following ways:

- Using the Rule Generator for Device Control group task.
  According to this scenario the group task generates rules lists basing on each computer system data about all mass storage devices that have ever been connected to protected servers. The task also allows for all mass storage devices that a connected at the moment of task running. Upon the group task completion Kaspersky Security for Windows Server generates allowing rules lists for all mass storage devices registered in the network and saves these lists in an XML file in a specified folder. Then you can manually import generated rules in the Device Control task settings. Unlike a task on a local computer, the policy does not allow configuring the automatic addition of the created rules to the list of Device Control rules when the Rule Generator for Device Control group task is completed.

  This scenario is recommended to generate allowing rules list before the first Device Control task start in the mode of active rules application.

- Based on a report on task events generated in Kaspersky Security Center for the Device Control task in the **Statistics only** mode.
  According to this scenario Kaspersky Security for Windows Server does not restrict mass storage devices connections but logs information about all devices connections and mass storage devices registration on all network servers during the Device Control task running in the **Statistics only** mode. The information logged may be found in the **Events** tab of the **Administration Server** node’s workspace in the Kaspersky Security Center. Kaspersky Security Center generates unified list of mass storage devices restricting and allowing events, based on the task log.

  You should configure the task running period the way that all the mass storage devices connections would be performed during the set period. Then as rules are added to the Device Control task you can import data on devices connections from the saved Kaspersky Security Center event report file (in TXT format) and generate Device Control allowing rules for such devices basing on this data. The type of events, that an imported log is based on, does not influence the generated rules type; only allowing rules are generated.

  This scenario is recommended to add allowing rules for a large number of new mass storage devices, as well as to generate rules for MTP-connected trusted mobile devices.

- Based on system data about connected mass storage devices (using the **Generate rules based on system data** option in the Device Control task settings).
  According to this scenario Kaspersky Security for Windows Server generates allowing rules for mass storage devices that have ever been connected or are currently connected to a computer with Kaspersky Security Center installed.

  This scenario is recommended to generate rules for a little number of new mass storage devices that you want to trust on all servers in the network.
Based on data about the currently connected devices (using the Generate rules based on connected devices).

In this scenario, Kaspersky Security for Windows Server generates allowing rules only for currently connected devices. You can select one or more devices for which you want to generate allowing rules.

Kaspersky Security for Windows Server does not get access to system data about mobile devices connected via MTP. You cannot generate allowing rules for trusted MTP-connected mobile devices using scenarios for rules list filling on the base of system data about all connected devices.

**Configuring the Rule Generator for Device Control task**

*To configure the Rule Generator for Device Control task, do the following:*

1. Open the Properties: Rule Generator for Device Control (see Section "Opening the Rule Generator for Device Control task wizard and properties" on page 402) window.
2. In the Notification section, configure the task event notification settings.

   For detailed information regarding configuring settings in this section, see the *Kaspersky Security Center Help*.

3. In the Settings section, you can configure the following settings:
   - Select the operation mode: consider system data about all mass storages that have ever been connected or consider currently connected mass storages only.
   - Configure settings for configuration files with allowing rules lists that Kaspersky Security for Windows Server creates upon the task completion.
4. Configure the task schedule in the Schedule section (you can configure a schedule for all task types except Rollback of Database Update).
5. In the Account section specify the account which rights will be used for the task execution.
6. If required, specify the objects to exclude from the task scope in the Exclusions from task scope section.

   For detailed information regarding configuring settings in these sections, see the *Kaspersky Security Center Help*.

7. In the Properties: <Task name> window, click OK.

   The newly configured group tasks settings are saved.
Configuring Device Control rules via the Kaspersky Security Center

Learn how to generate a list of rules based on various criteria or manually create allowing or denying rules using the Device Control task.

Creating allowing rules based on system data in a Kaspersky Security Center policy

 ► To specify allowing rules using the Generate rules based on system data option in the Device Control task:

1. If necessary, connect a new mass storage device that you want to make trusted to a computer with the Kaspersky Security Center Administration Console installed.
2. Open the Device Control rules window (see Section "Opening the Device Control rules list" on page 402).
3. Click the Add button and in the context menu that opens select the Generate rules based on system data option.
4. Select the principle for adding the allowing rules to the list of previously created Device Control rules:
   - In the device list of Generate rules based on the system information window, select a device.
   - Click Add rules for devices selected.
5. Click the Save button in the Device Control rules window.

Rules list in the Device Control task will be filled up with new rules generated basing on a system data of the computer with the Kaspersky Security Center Administration Console installed.

Generating rules for connected devices

 ► To specify allowing rules using the Generate rules based on connected devices option in the Device Control task:

1. Open the Device Control rules window (see Section "Opening the Device Control rules list" on page 402).
2. Click the Add button and in the context menu, select Generate rules based on connected devices. The Generate rules based on the system information window opens.
3. In the list of detected devices connected to the protected server, select the devices you want to generate allowing rules for.
4. Click the **Add rules for devices selected** button.

5. Click the **Save** button in the **Device Control rules** window.

Rules list in the Device Control task will be filled up with new rules generated basing on a system data of the computer with the Kaspersky Security Center Administration Console installed.

**Importing rules from the Kaspersky Security Center report on blocked devices**

You can import data on blocked device connections from the report generated in Kaspersky Security Center after completion of the Device Control task in **Statistics only** mode (see Section "Configuring the Device Control task" on page 403) and use this data to generate a list of Device Control allowing rules in the policy being configured.

When generating the report on events occurring during the Device Control task, you can keep track of the devices whose connection is restricted.

To specify allowing rules for devices connection for a group of servers based on the Kaspersky Security Center report on blocked devices:

1. In the policy properties, in the **Event notification** section, make sure that:

   - For the **Critical Events** importance level the period of time for storing the task log for the **Mass storage restricted** event exceeds the planned period of operation in the **Statistics only** mode (the default value is 30 days).

   - For the **Warning** importance level the period of time for storing the task log for the **Statistics only: untrusted mass storage detected** event exceeds the planned period of task operation in the **Statistics only** mode (the default value is 30 days).

   **When the period for storing the events elapses, information about logged events is deleted and is not reflected in the report file. Before running the Device Control task in **Statistics only** mode, make sure that the task run time does not exceed the configured storage time for the specified events.**

2. Start the Device Control task in the **Statistics only** mode. In the workspace of the **Administration Server** node in Kaspersky Security Center, select the **Events** tab. Click the **Create a selection** button and create a selection of events based on the **Untrusted mass storage detected** criterion to view the devices whose connections will be restricted by the Device Control task. In the details pane of the selection, click the **Export events to file** link to save the report on restricted connections to a **TXT** file.

   **Before importing and applying the generated report in a policy, make sure that the report contains data only on those devices whose connection you want to allow.**

3. Import data about restricted devices connections into the Device Control task:

   a. Open the **Device Control rules** window (see Section "Opening the Device Control rules list" on page 402).

   b. Click the **Add** button and in the context menu of the button select **Import data of blocked devices from Kaspersky Security Center report**.
c. Select the principle for adding rules from the list created on the basis of the Kaspersky Security Center report to the list of previously configured Device Control rules:

- **Add to existing rules** if you want to add the imported rules to the list of existing rules. Rules with identical settings are duplicated.

- **Replace existing rules** if you want to replace the existing rules with the imported rules.

- **Merge with existing rules** if you want to add the imported rules to the list of existing rules. Rules with identical settings are not added; the rule is added if at least one rule parameter is unique.

d. In the standard window of Microsoft Windows that opens, select the TXT file to which events from the report about restricted devices have been exported.

e. Click the **Save** button in the **Device Control rules** window.

4. Click **OK** the **Device Control** window.

Rules created on the basis of the Kaspersky Security Center report on restricted devices are added to the list of Device Control rules.

---

**Creating rules using the Rule Generator for Device Control task**

To specify allowing device control rules for a group of servers using the Rule Generator for Device Control task:

1. Open the **Settings** window in the **New Task Wizard** (see Section "Opening the Rule Generator for Device Control task wizard and properties" on page 402).

2. Configure the following:

   - In the **Mode** section:
     - **Consider system data about all mass storages that have ever been connected.**
     - **Consider currently connected mass storages only.**

   - In the **After task completes** section:
     - **Add allowing rules to the list of Device Control rules.**

     The check box enables or disables adding the newly generated allowing rules to the list of Device Control rules. The list of Device Control rules is displayed when you click the **Device Control rules** link in the details pane of the **Device Control** node.

     If this check box is selected, Kaspersky Security for Windows Server adds the rules generated by the Rule Generator for Device Control task to the list of Device Control rules based on the selected principle for adding rules.

     If this check box is cleared, Kaspersky Security for Windows Server does not add the newly generated allowing rules to the list of Device Control rules. The generated rules are only exported to a file.

     The check box is selected by default.

     The check box cannot be selected if the **Export allowing rules to file** check box has not been selected.
• **Principle of adding.**
  This drop-down list is used to specify the method used to add the newly generated allowing rules to the list of Applications Launch Control rules.
  - **Add to existing rules.** The rules are added to the list of existing rules. Rules with identical settings are duplicated.
  - **Replace existing rules.** The rules replace the existing rules in the list.
  - **Merge with existing rules.** The rules are added to the list of existing rules. Rules with identical settings are not added; the rule is added if at least one rule parameter is unique.

By default, the **Merge with existing rules** method is selected.

• **Export allowing rules to file.**
  The check box enables or disables export of allowing rules for Device Control to a file.
  If the check box is selected, Kaspersky Security for Windows Server exports the allowing rules to the file specified in the field below when the Rule Generator for Device Control task is finished.
  If this check box is cleared, the application does not export the generated allowing rules to a file when the Rule Generator for Device Control task is finished. Instead, it only adds them to the list of Device Control rules.

  The check box is cleared by default.

  The check box cannot be selected if the **Add allowing rules to the list of Device Control rules** check box has not been selected.

• **Add computer details to file name.**
  The check box enables or disables adding information about the protected server to the name of the file to which the allowing rules for Device Control will be exported.
  If this check box is selected, the application adds the protected server name and the file creation date and time to the name of the export file.
  If the check box is cleared, the application does not add information about the protected server to the name of the export file.

  The check box is selected by default.

3. Click **Next**.
4. In the **Schedule** window, set the scheduled task start settings.
5. Click **Next**.
6. In the **Selecting an account to run the task** window, specify the account you want to use.
7. Click **Next**.
8. Define a task name.
9. Click **Next**.

The task name should be no longer than 100 characters and cannot contain the following symbols: `

```
The Finish task creation window opens.
10. You can optionally run the task after the Wizard finishes by selecting the **Run task after Wizard finishes** check box.

11. Click **Finish** to finish creating the task.

12. On the **Tasks** tab on the workspace of the group of servers being configured, in the list of group tasks select the Rule Generator for Device Control you have created.

13. Click the **Start** button to start the task.

When the task is completed, automatically generated lists of allowing rules are saved in a shared folder in XML files.

Before using the Device Control policy in the network, make certain that all protected servers have access to a shared network folder. If the organization’s policy does not provide for the use of a shared network folder in the network, it is recommended to start the Automated Rules Generators task for server control rules on the test computer group or on a template machine.

### Adding generated rules to the Device Control rules list

*To add the generated lists of allowing rules to the Device Control task:*

1. Open the **Device Control rules** window (see Section "Opening the Device Control rules list" on page 402).
2. Click the **Add** button.
3. In the **Add** button context menu select the **Import rules from XML file** option.
4. Select the principle for adding the automatically generated allowing rules to the list of previously created Device Control rules:
   - **Add to existing rules** if you want to add the imported rules to the list of existing rules. Rules with identical settings are duplicated.
   - **Replace existing rules** if you want to replace the existing rules with the imported rules.
   - **Merge with existing rules** if you want to add the imported rules to the list of existing rules. Rules with identical settings are not added; the rule is added if at least one rule parameter is unique.
5. In the standard window of Microsoft Windows that opens, select XML files created after completion of the Rule Generator for Device Control group task.
6. Click **Open**.
   All generated rules from the XML file are added to the list according to the selected principle.
7. Click the **Save** button in the **Device Control rules** window.
8. If you want to apply generated device control rules, select the **Active** task mode in the **Device Control** policy settings.

Allowing rules automatically generated based on system data on each separate server are applied to all network servers covered by the policy being configured. On these servers, the application will allow connection of only those devices for which allowing rules have been created.
Managing Device Control via the Application Console

In this section, learn how to navigate the Application Console interface and configure task settings on a local server.

In this section

| Navigation .................................................................................................................. 411 |
| Configuring Device Control task settings ................................................................. 412 |
| Configuring Device Control rules ............................................................................. 413 |
| Configuring Rule Generator for Device Control task .................................................. 417 |

Navigation

Learn how to navigate to the required task settings via the interface.

In this section

| Opening the Device Control task settings .................................................................. 411 |
| Opening the Device Control rules window .................................................................. 411 |
| Opening the Rule Generator for Device Control task settings ...................................... 412 |

Opening the Device Control task settings

▲ To open the Device Control task settings via the Application Console:

1. In the Application Console tree, expand the Server Control node.
2. Select the Device Control child node.
3. In the details pane of the Device Control child node, click the Properties link.
   The Task settings window opens.
4. Configure the task as required.

Opening the Device Control rules window

▲ To open the Device Control rules list via the Application Console:

1. In the Application Console tree, expand the Server Control node.
2. Select the Device Control child node.
3. In the details pane of the Device Control node, click the Device Control rules link.
   The Device Control rules window opens.
4. Configure the rules list as required.
Opening the Rule Generator for Device Control task settings

To configure the Rule Generator for Device Control task:

1. In the Application Console tree, expand the Automated rule generators node.
2. Select the Rule Generator for Device Control child node.
3. In the details pane of the Rule Generator for Device Control child node, click the Properties link.
   The Task settings window opens.
4. Configure the task as required.

Configuring Device Control task settings

To configure the Device Control task settings:

1. Open the Task settings window (see Section “Opening the Device Control task settings” on page 411).
2. On the General tab, configure the following task settings:
   - In the Task mode section, select one of the task modes:
     - Active.
     Kaspersky Security for Windows Server applies rules to control the connection of flash-drives and other external devices, and allows or blocks the use of all devices according to the Default Deny principle and specified allowing rules. The use of trusted external devices is allowed. The use of untrusted external devices is blocked by default.
   
     If an external device you consider to be untrusted is connected to a protected server before the Device Control task is run in the Active mode, the device is not blocked by the application. We recommend that you disconnect the untrusted device manually or restart the computer. Otherwise, the Default Deny principle will not be applied to the device.

     - Statistics only.
     Kaspersky Security for Windows Server does not control the connection of flash-drives and other external devices, but only logs information about the connection and registration of external devices on a protected server, and about the Device Control allowing rules triggered by the connected devices. The use of all external devices is allowed. This mode is set by default.

     - Select or clear the Allow using all mass storage devices when the Device Control task is not running check box.
     The check box allows or blocks the use of mass storage devices when the Device Control task is not running.
     If the check box is selected and Device Control task is not running, Kaspersky Security for Windows Server allows using any mass storage devices on a protected server.
If the check box is cleared, the application blocks the use of untrusted mass storage devices on a protected server in the following cases: the Device Control task is not running or the Kaspersky Security Service is turned off. This option is recommended to maximize the level of protection against computer security threats arising when exchanging files with external devices.

The check box is cleared by default.

3. If necessary, on the Schedule and Advanced tabs, configure the scheduled task start settings (see Section “Configuring the task start schedule settings” on page 153).

4. To edit the list of device control rules (see Section "About Device Control rules list filling" on page 397), click the Device Control rules link in the lower part of the details pane of the Device Control node.

Kaspersky Security for Windows Server immediately applies the new settings to the running task. Information about the date and time when the settings were modified, and the values of task settings before and after modification, are saved in the system audit log.

Configuring Device Control rules

Learn how to generate, import and export a list of rules, or manually create allowing or denying rules using the Device Control task.

Importing Device Control rules from XML file

To import the Device Control rules, take the following steps:

1. Open the Device Control rules (see Section "Opening the Device Control rules window" on page 411) window.
2. Click the Add button.
3. In the context menu of the button, select Import rules from XML file.
4. Specify the method for adding the imported rules. To do so, select one of the options from the context menu of the Import rules from XML file button:
   - Add to existing rules if you want to add the imported rules to the list of existing ones. Rules with identical settings are duplicated.
• **Replace existing rules** if you want to replace the existing rules with the imported ones.

• **Merge with existing rules** if you want to add the imported rules to the list of existing ones. Rules with identical settings are not added; the rule is added if at least one rule parameter is unique.

The standard Microsoft Windows **Open** window opens.

5. In the **Open** window, select the XML file that contains the settings of the Device Control rules.

6. Click the **Open** button.

The imported rules will be displayed in the list of the **Device Control rules** window.

### Filling rules list basing on Device Control task events

► *To create a configuration file that contains device control rules list basing on the Device Control task events:*

1. Start the Device Control task in the **Statistics only** (see Section "Configuring Device Control task settings" on page 412) mode, to log all events of flash drives and other external devices connections to a protected server.

2. Upon the completion of the task in the **Statistics only** mode, open the task log by clicking the **Open task log** button in the **Management** section of the **Device Control** node details pane.

3. In the **Logs** window click the **Generate rules based on events**.

Kaspersky Security for Windows Server will create an XML configuration file that contains a rules list generated basing on events of the Device Control task in the **Statistics only** mode. You can apply this list in the **Device Control task** (see Section "Importing Device Control rules from XML file" on page 413).

Before applying a rules list generated basing on the task events, it is recommended to review and then manually process the rules list to make certain that there are no untrusted devices allowed by the specified rules.

During the conversion of an XML file with the task events to a rules list, the application generates allowing rules for all registered events, including the devices restrictions.

All the task events are registered in the task log regardless of the task mode. You can create a configuration file with a rules list basing on the events of the task in the **Active** mode. This scenario is not recommended except urgent cases, as far as the task efficiency requires to generate a final rule list version before the task is run in the active mode.

### Adding an allowing rule for one or several external devices

The function of manual adding rules by ones is not supported in the Device Control task. However, in cases when you need to add rules for one or several new external devices you can use the **Generate rules basing on system data** option. If this scenario is applied, the application uses Windows data about all ever connected external devices and also allows for currently connected devices for filling an allowing rules list.
Kaspersky Security for Windows Server does not get access to system data about mobile devices connected via MTP. You cannot generate allowing rules for MTP-connected mobile devices.

► **To add an allowing rule for one or several external devices that are currently connected:**

1. Open the Device Control rules window (see Section "Opening the Device Control rules window" on page 411).
2. Click the **Add** button.
3. In the context menu that opens select the **Generate rules based on system data** option.
4. In the window that opens, review the detected devices list and select a single device or several devices that you want to trust on a protected server.
5. Click the **Add rules for devices selected** button.

New rules will be generated and added to the device control rules list.

**Removing Device Control rules**

► **To remove the Device Control rules:**

1. Open the Device Control rules (see Section "Opening the Device Control rules window" on page 411) window.
2. In the list, select one or several rules that you want to delete.
3. Click the **Remove Selected** button.
4. Click the **Save** button.

The selected Device Control rules will be removed.

**Exporting Device Control rules**

► **To export Device Control rules to a configuration file:**

1. Open the Device Control rules (see Section "Opening the Device Control rules window" on page 411) window.
2. Click the **Export to a file** button.

   The standard Microsoft Windows window opens.
3. In the window that opens, specify the file to which you want to export the rules. If no such file exists, it will be created. If a file with the specified name already exists, its contents will be rewritten after the rules are exported.
4. Click the **Save** button.

The rules and its settings will be exported in the specified file.

**Activating and deactivating of Device Control rules**

You can activate and deactivate created device control rules without removing them.
To activate or deactivate a created device control rule, take the following steps:

1. Open the **Device Control rules** (see Section "Opening the Device Control rules window" on page 411) window.
2. In the list of specified rules open the **Rule properties** window by double clicking on the rule whose properties you want to configure.
3. In the window that opens, select or clear the **Apply rule** check box.
   
   The check box enables or disables a device control rule.
   
   If the check box is selected for a rule, the rule is activated. Connection for the external devices that are included into the rule usage scope is allowed.
   
   If the check box is cleared in the rule properties, the rule is inactive. Connection for the external devices that are included into the rule usage scope is blocked.
   
   By default the check box is selected in the settings for each created rule.
4. Click **OK**.
   
   Rule apply status will be saved and displayed for a specified rule.

Expanding Device Control rules usage scope

Each automatically generated device control rule covers only one external device. You can manually expand a rule usage scope by setting the device instance path mask in properties of any specified rule.

Device instance path application reduces the total number of rules specified and simplifies rules processing. But expanding of a rule usage scope can lead to decreasing of mass storage devices control efficiency.

To apply a device instance path mask in a device control rule properties:

1. Open the **Device Control rules** (see Section "Opening the Device Control rules window" on page 411) window.
2. In the window that opens, select a rule to use its properties for mask application.
3. Open the **Rule properties** window by double clicking on a selected device control rule.
4. In the window that opens, perform the following operations:
   
   - Select the **Use mask** check box next to the **Controller type (PID)** field if you want a rule selected to allow connections for all mass storage devices that fit the specified information about device manufacturer and device serial number.
   - Select the **Use mask** check box next to the **Serial number** field if you want a rule selected to allow connections for all mass storage devices that fit the specified information about device manufacturer and controller type.
   - Select the **Use mask** check boxes next to the **Controller type (PID)** field and the **Serial number** field if you want a rule selected to allow connections for all mass storage devices that fit the specified information about device manufacturer.

   If the **Use mask** check box is selected in at least one of the fields, the data from the fields with the selected check box is replaced with the * sign and is not considered when the rule is applied.
5. If necessary, specify additional information about rule in the **Description** field. For example, specify the devices affected by the rule.

6. Click **OK**.

The newly configured rule properties will be saved. The rule usage scope will be expanded according to a device instance path mask specified.

**Configuring Rule Generator for Device Control task**

*To configure the Rule Generator for Device Control task:*

1. In the Application Console tree, expand the **Automated rule generators** node.
2. Select the **Rule Generator for Device Control** child node.
3. Click the **Properties** link in the details pane of the **Rule Generator for Device Control** node. The **Task settings** window opens.
4. On the **General** tab, select the task operation mode in the **Task mode** section:
   - Consider system data about all mass storages that have ever been connected.
   - Consider currently connected mass storages only.
5. In the **After task completes** section, specify the actions that must be performed by Kaspersky Security for Windows Server upon task completion:
   - **Add allowing rules to the list of Device Control rules.**
     The check box enables or disables adding the newly generated allowing rules to the list of Device Control rules. The list of Device Control rules is displayed when you click the **Device Control rules** link in the details pane of the **Device Control** node.

     If this check box is selected, Kaspersky Security for Windows Server adds the rules generated by the Rule Generator for Device Control task to the list of Device Control rules based on the selected principle for adding rules.

     If this check box is cleared, Kaspersky Security for Windows Server does not add the newly generated allowing rules to the list of Device Control rules. The generated rules are only exported to a file.

     The check box is selected by default.

     The check box cannot be selected if the **Export allowing rules to file** check box has not been selected.

   - **Principle of adding.**
     This drop-down list is used to specify the method used to add the newly generated allowing rules to the list of Applications Launch Control rules.

     - **Add to existing rules.** The rules are added to the list of existing rules. Rules with identical settings are duplicated.
     - **Replace existing rules.** The rules replace the existing rules in the list.
• **Merge with existing rules.** The rules are added to the list of existing rules. Rules with identical settings are not added; the rule is added if at least one rule parameter is unique.

By default, the **Merge with existing rules** method is selected.

• **Export allowing rules to file.**

  The check box enables or disables export of allowing rules for Device Control to a file.

  If the check box is selected, Kaspersky Security for Windows Server exports the allowing rules to the file specified in the field below when the Rule Generator for Device Control task is finished.

  If this check box is cleared, the application does not export the generated allowing rules to a file when the Rule Generator for Device Control task is finished. Instead, it only adds them to the list of Device Control rules.

  The check box is cleared by default.

  The check box cannot be selected if the **Add allowing rules to the list of Device Control rules** check box has not been selected.

• **Add computer details to file name.**

  The check box enables or disables adding information about the protected server to the name of the file to which the allowing rules for Device Control will be exported.

  If this check box is selected, the application adds the protected server name and the file creation date and time to the name of the export file.

  If the check box is cleared, the application does not add information about the protected server to the name of the export file.

  The check box is selected by default.

6. On the **Schedule** and **Advanced** tabs, configure the scheduled task start settings (see Section "Configuring the task start schedule settings" on page 153).

7. Click **OK**.

Kaspersky Security for Windows Server immediately applies the new settings to the running task. Information about the date and time when the settings were modified, and the values of task settings before and after modification, are saved in the system audit log.
Firewall Management

This section contains information about the Firewall Management task and how to configure it.

About the Firewall Management task

Kaspersky Security for Windows Server provides a reliable and ergonomic solution for protecting network connections using the Firewall Management task.

The Firewall Management task does not perform independent network traffic filtering, but it allows you to manage Windows Firewall through the Kaspersky Security for Windows Server graphical interface. During the Firewall Management task, Kaspersky Security for Windows Server takes over management of the settings and policies of the operating system's firewall and blocks any possibility of external firewall configuration.

During installation of the application, the Firewall Management component reads and copies the Windows Firewall status and all specified rules. After that, the set of rules and the rule parameters may only be changed, and the firewall may only be turned on or off in Kaspersky Security for Windows Server.

If Windows Firewall is turned off during installation of Kaspersky Security for Windows Server, the Firewall Management task will not be executed after the installation completes. If Windows Firewall is turned on during installation of the application, the Firewall Management task is executed after the installation completes, blocking all network connections that are not allowed by the specified rules.

The Firewall Management component is not installed by default, as it is not included in the set of components for the Recommended Installation.

The Firewall Management task enforces blocking of all incoming and outgoing connections not allowed by the task's specified rules.

The task polls the Windows Firewall regularly and monitors its status. By default, the polling interval is set to 1 minute and cannot be changed. If during polling Kaspersky Security for Windows Server detects a mismatch between the Windows Firewall settings and the Firewall Management task settings, the application forcibly applies the task settings on the operating system firewall.
With minute-by-minute polling of the Windows Firewall, Kaspersky Security for Windows Server monitors the following:

- Operating status of the Windows Firewall.
- Status of rules added after installation of Kaspersky Security for Windows Server by other applications or tools (for example, the addition of a new application rule for a port/application using wf.msc).

When applying the new rules to Windows Firewall, Kaspersky Security for Windows Server creates a Kaspersky Security Group rule set in the Windows Firewall snap-in. This rule set unites all the rules created by Kaspersky Security for Windows Server using the Firewall Management task. The rules in the Kaspersky Security Group are not monitored by the application during the polling each minute and are not automatically synchronized with the list of rules specified in the Firewall Management task settings.

► To update the Kaspersky Security Group rules manually,

restart the Kaspersky Security for Windows Server Firewall Management task.

You can also edit the Kaspersky Security Group rules manually using the Windows Firewall snap-in.

If Windows Firewall is managed by the Kaspersky Security Center group policy, the Firewall Management task cannot be started.

About Firewall rules

The Firewall Management task controls filtration of incoming and outgoing network traffic using allowing rules forcibly applied to the Windows Firewall during task execution.

The first time the task is started Kaspersky Security for Windows Server reads and copies all the incoming network traffic rules specified in the Windows Firewall settings to the Firewall Management task settings. Then the application operates according to the following rules:

- If a new rule is created in the Windows Firewall settings (manually or automatically during a new application installation), Kaspersky Security for Windows Server deletes the rule.
- If an existing rule is deleted from the Windows Firewall settings, Kaspersky Security for Windows Server restores the rule when the task is restarted.
- If the parameters of an existing rule are changed in the Windows Firewall settings, Kaspersky Security for Windows Server rolls back the changes.
- If a new rule is created in the Firewall Management settings, Kaspersky Security for Windows Server forcibly applies the rule to Windows Firewall.
- If an existing rule is deleted from the Firewall Management settings, Kaspersky Security for Windows Server forcibly deletes the rule from the Windows Firewall settings.

You can set, delete and edit filtration rules for incoming network traffic.

You cannot specify a new rule to control outgoing network traffic in the Firewall Management task settings. All Firewall rules specified in Kaspersky Security for Windows Server control only incoming network traffic.

You can manage the following types of Firewall rules:

- Application rules.
- Port rules.

**Application rules**

This type of rule allows targeted network connections for specified applications. The triggering criterion for these rules is based on a path to an executable file.

You can manage application rules:

- Add new rules.
- Remove existing rules.
- Enable or disable specified rules.
- Edit the parameters of the specified rules: specify the rule name, path to the executable file, and the rule usage scope.

**Port rules**

This type of rule allows network connections for specified ports and protocols (TCP / UDP). The triggering criteria for these rules are based on the port number and protocol type.

You can manage port rules:

- Add new rules.
- Remove existing rules.
- Enable or disable specified rules.
- Edit the parameters of the specified rules: set the rule name, port number, protocol type, and scope for application of the rule.

Port rules imply a broader scope than application rules. By allowing connections based on port rules, you lower the security level of the protected server.
Default Firewall Management task settings

The Firewall Management task uses the default settings described in the table below. You can change the values of these settings.

<table>
<thead>
<tr>
<th>Setting</th>
<th>Default value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Firewall rules for application</td>
<td>Two default rules for application enabled</td>
<td>You can disable the default rules or add new rules.</td>
</tr>
<tr>
<td>Firewall rules for ports</td>
<td>Six default rules for ports enabled</td>
<td>You can disable the default rules or add new rules.</td>
</tr>
<tr>
<td>Task start schedule</td>
<td>First run is not scheduled.</td>
<td>The Firewall Management task does not start automatically at the start of Kaspersky Security for Windows Server. You can configure the task start schedule.</td>
</tr>
</tbody>
</table>

Managing Firewall rules via the Administration Plug-in

In this section, learn how to manage Firewall rules via the Application Console interface.

In this section

- Enabling and disabling Firewall rules ................................................................. 422
- Adding Firewall rules manually ............................................................................. 423
- Deleting Firewall rules ......................................................................................... 425

Enabling and disabling Firewall rules

► To enable or disable an existing rule for filtering incoming network traffic, perform the following actions:

1. Expand the **Managed devices** node in the Kaspersky Security Center Administration Console tree.
2. Select the administration group for which you want to configure application settings.
3. Perform one of the following actions in the details pane of the selected administration group:
   - To configure application settings for a group of servers, select the **Policies** tab and open the **Properties: <Policy name>** window (see Section "Configuring policy" on page 119).
   - To configure the application for a single server, select the **Devices** tab and open the **Application settings** window (see Section "Configuring local tasks in the Application settings window of the Kaspersky Security Center" on page 124).
If an active Kaspersky Security Center policy is applied to a device, and this policy blocks changes to application settings, then these settings cannot be edited in the Application settings window.

4. In the Network activity control section click the Settings button in the Firewall Management subsection.
5. Click the Rules list button in the window that opens.
   The Firewall rules window opens.
6. Depending on the type of the rule whose status you want to modify, select Applications or Ports.
7. In the rule list, select the rule whose status you want to modify and perform one of the following actions:
   • If you want to enable a disabled rule, select the check box to the left of the rule name.
     The selected rule is enabled.
   • If you want to disable an enabled rule, clear the check box to the left of the rule name.
     The selected rule is disabled.
8. Click OK in the Firewall rules window.
9. Click OK in the Firewall Management window.
10. Click OK in the Properties: <Policy name> window.
    The specified task settings are saved. The new rule parameters will be sent to Windows Firewall.

Adding Firewall rules manually

You can only add and edit rules for applications and ports. You cannot add new or edit existing group rules.

▶ To add a new or edit an existing rule for filtering incoming network traffic, do the following:

1. Expand the Managed devices node in the Kaspersky Security Center Administration Console tree.
2. Select the administration group for which you want to configure application settings.
3. Perform one of the following actions in the details pane of the selected administration group:
   • To configure application settings for a group of servers, select the Policies tab and open the Properties: <Policy name> window (see Section "Configuring policy" on page 119).
   • To configure the application for a single server, select the Devices tab and open the Application settings window (see Section "Configuring local tasks in the Application settings window of the Kaspersky Security Center" on page 124).

If an active Kaspersky Security Center policy is applied to a device, and this policy blocks changes to application settings, then these settings cannot be edited in the Application settings window.

4. In the Network activity control section click the Settings button in the Firewall Management subsection.
5. Click the **Rules list** button in the window that opens. The **Firewall rules** window opens.

6. Depending on the type of rule you want to add, select the **Applications** or **Ports** tab and perform one of the following actions:
   - To edit an existing rule, select the rule you want to edit in the rule list and click **Edit**.
   - To add a new rule, click **Add**.
     Depending on the type of rule being configured, the **Port rule** window or **Application rule** window opens.

7. In the window that opens, perform the following operations:
   - If you are working with an application rule, do the following:
     a. Enter the **Rule name** of the edited rule.
     b. Specify the **Application path** to the executable file of the application for which you are allowing a connection by modifying this rule.
        You can set the path manually or by using the **Browse** button.
     c. In the **Rule application scope** field, specify the network addresses for which the modified rule will be applied.
        You can only use IPv4 IP-addresses.
   - If you are working with a port rule, do the following:
     a. Enter the **Rule name** of the edited rule.
     b. Specify the **Port number** for which the application will allow connections.
     c. Select the type of protocol (TCP / UDP) for which the application will allow connections.
     d. In the **Rule application scope** field, specify the network addresses for which the modified rule will be applied.
        You can only use IPv4 IP-addresses.

8. Click **OK** in the **Application rule** or **Port rule** window.
9. Click **OK** in the **Firewall Management** window.
10. Click **OK** in the **Properties: <Policy name>** window.
    The specified task settings are saved. The new rule parameters will be sent to Windows Firewall.
Deleting Firewall rules

You can only delete application and port rules. You cannot delete existing group rules.

To delete an existing rule for filtering incoming network traffic, perform the following actions:

1. Expand the Managed devices node in the Kaspersky Security Center Administration Console tree.
2. Select the administration group for which you want to configure application settings.
3. Perform one of the following actions in the details pane of the selected administration group:
   • To configure application settings for a group of servers, select the Policies tab and open the Properties: <Policy name> window (see Section "Configuring policy" on page 119).
   • To configure the application for a single server, select the Devices tab and open the Application settings window (see Section "Configuring local tasks in the Application settings window of the Kaspersky Security Center" on page 124).

If an active Kaspersky Security Center policy is applied to a device, and this policy blocks changes to application settings, then these settings cannot be edited in the Application settings window.

4. In the Network activity control section click the Settings button in the Firewall Management subsection.
5. Click the Rules list button in the window that opens.
   The Firewall rules window opens.
6. Depending on the type of rule whose status you want to modify, select the Applications or Ports tab.
7. In the rule list, select the rule you want to delete.
8. Click the Remove button.
   The selected rule is deleted.
9. Click OK in the Firewall rules window.
10. Click OK in the Firewall Management window.
11. Click OK in the Properties: <Policy name> window.

The specified Firewall Management task settings are saved. The new rule parameters will be sent to Windows Firewall.
Managing Firewall rules via the Application Console

In this section, learn how to manage Firewall rules via the Application Console interface.

In this section

<table>

Enabling and disabling Firewall rules

► To enable or disable an existing rule for filtering incoming network traffic, perform the following actions:

1. In the Application Console tree, expand the **Server Control** node.
2. Select the **Firewall Management** child node.
3. Click the **Firewall rules** link in the details pane of the **Firewall Management** node.
   The **Firewall rules** window opens.
4. Depending on the type of the rule whose status you want to modify, select **Applications** or **Ports**.
5. In the rule list, select the rule whose status you want to modify and perform one of the following actions:
   - If you want to enable a disabled rule, select the check box to the left of the rule name.
     The selected rule is enabled.
   - If you want to disable an enabled rule, clear the check box to the left of the rule name.
     The selected rule is disabled.
6. Click **Save** in the **Firewall rules** window.
   The specified task settings are saved. The new rule parameters will be sent to Windows Firewall.

Adding Firewall rules manually

► To add a new or edit an existing rule for filtering incoming network traffic, do the following:

1. In the Application Console tree, expand the **Server Control** node.
2. Select the **Firewall Management** child node.
3. Click the **Firewall rules** link in the details pane of the **Firewall Management** node.
   The **Firewall rules** window opens.
4. Depending on the type of rule you want to add, select the Applications or Ports tab and perform one of the following actions:
   - To edit an existing rule, select the rule you want to edit in the rule list and click Edit.
   - To add a new rule, click Add.
     Depending on the type of rule being configured, the Port rule window or Application rule window opens.

5. In the window that opens, perform the following operations:
   - If you are working with an application rule, do the following:
     a. Enter the Rule name of the edited rule.
     b. Specify the Application path to the executable file of the application for which you are allowing a connection by modifying this rule.
        You can set the path manually or by using the Browse button.
     c. In the Rule application scope field, specify the network addresses for which the modified rule will be applied.
        You can only use IPv4 IP-addresses.
   - If you are working with a port rule, do the following:
     a. Enter the Rule name of the edited rule.
     b. Specify the Port number for which the application will allow connections.
     c. Select the type of protocol (TCP / UDP) for which the application will allow connections.
     d. In the Rule application scope field, specify the network addresses for which the modified rule will be applied.
        You can only use IPv4 IP-addresses.

6. Click OK in the Application rule or Port rule window.
7. Click Save in the Firewall rules window.
The specified task settings are saved. The new rule parameters will be sent to Windows Firewall.

**Deleting Firewall rules**

You can only delete application and port rules. You cannot delete existing group rules.

► To delete an existing rule for filtering incoming network traffic, perform the following actions:

1. In the Application Console tree, expand the Server Control node.
2. Select the Firewall Management child node.
3. Click the **Firewall rules** link in the details pane of the **Firewall Management** node.
   
   The **Firewall rules** window opens.

4. Depending on the type of rule whose status you want to modify, select the **Applications** or **Ports** tab.

5. In the rule list, select the rule you want to delete.

6. Click the **Remove** button.
   
   The selected rule is deleted.

7. Click **Save** in the **Firewall rules** window.
   
   The specified task settings are saved. The new rule parameters will be sent to Windows Firewall.
File Integrity Monitor

This section contains information about starting and configuring the File Integrity Monitor task.

In this chapter

About the File Integrity Monitor task ................................................................. 429
About file operation monitoring rules .............................................................. 430
Default File Integrity Monitor task settings ...................................................... 432
Managing File Integrity Monitor via the Administration Plug-in ......................... 433
Managing File Integrity Monitor via the Application Console ............................. 437

About the File Integrity Monitor task

The File Integrity Monitor task is designed to track actions performed with the specified files and folders in the monitoring scopes specified in the task settings. You can use the task to detect file changes that may indicate a security breach on the protected server. You can also configure file changes to be tracked during periods in which monitoring is interrupted.

A monitoring interruption occurs when the monitoring scope temporarily falls outside the scope of the task, e.g. if the task is stopped or if a mass storage device is not physically present on a protected server. Kaspersky Security for Windows Server reports detected file operations in the monitoring scope as soon as a mass storage device is reconnected.

If the tasks stops running in the specified monitoring scope due to a reinstallation of the File Integrity Monitor component, this does not constitute a monitoring interruption. In this case, the File Integrity Monitor task is not run.

Requirements on the environment

To start the File Integrity Monitor task, the following conditions must be satisfied:

- A mass storage device that supports the ReFS and NTFS file systems must be installed on the protected server.
- The Windows USN Journal must be enabled. The component queries this journal to receive information about file operations.

If you enable USN Journal after a rule has been created for a volume and the File Integrity Monitor task has been started, the task must be restarted. If not, the rule will not be applied during monitoring.
Excluded monitoring scopes

You can create excluded monitoring scopes (see Section “Configuring monitoring rules” on page 434). Exclusions are specified for each separate rule, and work only for the indicated monitoring scope. You can specify an unlimited number of exclusions for each rule.

Exclusions have higher priority than the monitoring scope and are not monitored by the task, even if an indicated folder or file is in the monitoring scope. If the settings for one of the rules specify a monitoring scope at a lower level than a folder specified in exclusions, the monitoring scope is not considered when the task is run.

To specify exclusions, you can use the same masks that are used to specify monitoring scopes.

About file operation monitoring rules

The File Integrity Monitor is run based on file operation monitoring rules. You can use rule triggering criteria to configure the conditions that trigger the task, and adjust the importance level of events for detected file operations recorded in the task log.

A file operation monitoring rule is specified for each monitoring scope.

You can configure the following rule triggering criteria:

- Trusted users.
- File operation markers.

Trusted users

By default, the application treats all user actions as potential security breaches. The trusted user list is empty. You can configure the event importance level by creating a list of trusted users in the file operation monitoring rule settings.

*Untrusted user* – any user not indicated in the trusted user list in the monitoring scope rule settings. If Kaspersky Security for Windows Server detects a file operation performed by an untrusted user, the File Integrity Monitor task records a Critical event in the task log.

*Trusted user* – a user or group of users authorized to perform file operations in the specified monitoring scope. If Kaspersky Security for Windows Server detects file operations performed by a trusted user, the File Integrity Monitor task records an Informational event in the task log.

Kaspersky Security for Windows Server cannot determine the users that initiate operations during monitoring interruption periods. In this case, the user status is determined to be unknown.

*Unknown user* – This status is assigned to a user if Kaspersky Security for Windows Server cannot receive information about a user due to a task interruption or a failure of the data synchronization driver or USN Journal. If Kaspersky Security for Windows Server detects a file operation performed by an unknown user, the File Integrity Monitor task records a Warning event in the task log.
**File operation markers**

When the File Integrity Monitor task runs, Kaspersky Security for Windows Server uses file operation markers to determine that an action has been performed on a file.

A file operation marker is a unique descriptor that can characterize a file operation.

Each file operation can be a single action or a chain of actions with files. Each action of this kind is equated to a file operation marker. If the marker you specify as a rule triggering criterion is detected in a file operation chain, the application logs an event indicating that the given file operation was performed.

The importance level of the logged events does not depend on the selected file operation markers or the number of events.

---

By default, Kaspersky Security for Windows Server considers all available file operation marker. You can select file operation markers manually in the task’s rule settings.

### Managing File Integrity Monitor via the Administration Plug-in

In this section, learn how to configure the File Integrity Monitor task via the Administration Plug-in.

In this section

- Configuring the File Integrity Monitor task settings ................................................. 433
- Configuring monitoring rules .......................................................................................... 434

### Configuring the File Integrity Monitor task settings

To configure general File Integrity Monitor task settings, perform the following steps:

1. Expand the **Managed devices** node in the Kaspersky Security Center Administration Console tree.
2. Select the administration group for which you want to configure application settings.
3. Perform one of the following actions in the details pane of the selected administration group:
   - To configure application settings for a group of servers, select the **Policies** tab and open the **Properties: <Policy name>** window (see Section “Configuring policy” on page 119).
   - To configure the application for a single server, select the **Devices** tab and open the **Application settings** window (see Section “Configuring local tasks in the Application settings window of the Kaspersky Security Center” on page 124).

   **Note:** If an active Kaspersky Security Center policy is applied to a device, and this policy blocks changes to application settings, then these settings cannot be edited in the **Application settings** window.

4. In the **System Inspection** section in the **File Integrity Monitor** block, click the **Settings** button. The **File Integrity Monitor** window opens.
5. In the **File operations monitoring settings** tab in the window that opens, configure the monitoring scope settings:

   a. Clear or select the **Log information about file operations that appear during the monitoring interruption period** check box.

      The check box enables or disables monitoring of the file operations specified in the File Integrity Monitor task settings when the task is not running for any reason (removal of a hard disk, task stopped by user, software error).

      If the check box is selected, Kaspersky Security for Windows Server will record events in all monitoring scopes when the File Integrity Monitor task is not running.

      If the check box is cleared, the application will not log file operations in monitoring scopes when the task is not running.

      The check box is selected by default.

   b. Add the monitoring scopes (see Section "Configuring monitoring rules" on page 434) to be monitored by the task.

6. On the **Task management** tab, configure the task start parameters based on a schedule (see Section "Managing task schedules" on page 134).

7. Click **OK** to save changes.

### Configuring monitoring rules

You can change the default settings of the File Integrity Monitor task (see the table below).

**Table 64. Default File Integrity Monitor task settings**

<table>
<thead>
<tr>

</tr>
</tbody>
</table>

To add a monitoring scope, perform the following steps:

1. Expand the Managed devices node in the Kaspersky Security Center Administration Console tree.
2. Select the administration group for which you want to configure application settings.
3. Perform one of the following actions in the details pane of the selected administration group:
   - To configure application settings for a group of servers, select the Policies tab and open the Properties: <Policy name> window (see Section "Configuring policy" on page 119).
   - To configure the application for a single server, select the Devices tab and open the Application settings window (see Section "Configuring local tasks in the Application settings window of the Kaspersky Security Center" on page 124).

4. In the System Inspection section in the File Integrity Monitor block, click the Settings button. The Properties: File Integrity Monitor window opens.
5. In the Monitoring scope section, click the Add button. The Monitoring scope window opens.
6. Add a monitoring scope in one of the following ways:
   - If you want to select folders through the standard Microsoft Windows dialog:
     a. Click the Browse button. The standard Microsoft Windows Browse for Folder window opens.
     b. In the window that opens, select the folder for which you want to monitor operations, and click the OK button.
   - If you want to specify a monitoring scope manually, add a path using a supported mask:
     - `<*.ext>` - all files with the extension `<ext>`, regardless of their location;
     - `<\name.ext>` - all files with name `<name>` and extension `<ext>`, regardless of their location;
     - `<dir\>` - all files in folder `<dir>`;
     - `<dir\name.ext>` - all files with the name `<name>` and extension `<ext>` in folder `<dir>` and all of its child folders.
When specifying a monitoring scope manually, be sure that the path is in the following format: `<volume letter>:\<mask>`. If the volume letter is missing, Kaspersky Security for Windows Server will not add the specified monitoring scope.

7. In the **Trusted users** tab, click the **Add** button. The standard Microsoft Windows **Select Users or Groups** window opens.

8. Select the users or groups of users for whom file operations are allowed in the selected monitoring scope, and click the **OK** button.

9. Select the **File operation markers** tab.

10. If required, perform the following actions to select a number of markers:
   a. Select the **Detect file operations basing on the following markers** option.
   b. In the list of available file operations (see Section "About file operation monitoring rules" on page 430), select the check boxes next to the operations you want to monitor.

11. If you want Kaspersky Security for Windows Server to calculate files checksum after operation is performed, do the following:
   a. Select the **Calculate checksum for the file if possible. The checksum will be available for viewing in the task report** check box.
      - If the check box is selected, Kaspersky Security for Windows Server calculates the checksum of the modified file, where the file operation with at least one selected marker was detected.
      - If the file operation is detected by a number of markers, only the final file checksum after all modifications is calculated.
      - If the check box is cleared, Kaspersky Security for Windows Server does not calculate the checksum for the modified files.

      No checksum calculation is performed in the following cases:
      - If the file became unavailable (for example, due to the change of access permissions).
      - If the file operation is detected in the file that has been removed afterwards.

      The check box is cleared by default.
   b. In the **Calculate the checksum using the algorithm** drop down list select one of the options:
      - **MD5 hash**
      - **SHA256 hash**
12. If you do not want to monitor all file operations in the list of available file operations (see Section "About file operation monitoring rules" on page 430), and select the check boxes next to the operations you want to monitor.

13. If necessary, add excluded monitoring scopes by performing the following steps:
   a. Select the **Exclusions** tab.
   b. Select the **Exclude the following folders from control** check box.
      The check box disables use of exclusions for folders where file operations do not need to be monitored.
      If the check box is selected, Kaspersky Security for Windows Server skips the monitoring scopes specified in the exclusions list when the File Integrity Monitor task is run.
      If the check box is cleared, Kaspersky Security for Windows Server logs events for all specified monitoring scopes.
      By default, the check box is cleared and the exclusion list is empty.
   c. Click the **Add** button.
      The **Select folder to add** window opens.
   d. In the window that opens, specify the folder that you want to exclude from the monitoring scope.
   e. Click **OK**.
      The specified folder is added to the list of excluded scopes.

14. Click **OK** in the **File operations monitoring rule** window.
   The specified rule settings will be applied to the selected monitoring scope of the File Integrity Monitor task.

---

**Managing File Integrity Monitor via the Application Console**

In this section, learn how to configure the File Integrity Monitor task via the Application Console.

**In this section**

<table>

</table>

**Configuring the File Integrity Monitor task settings**

► To configure general File Integrity Monitor task settings, perform the following steps:

1. In the Application Console tree, expand the **System Inspection** node.
2. Select the **File Integrity Monitor** child node.
3. Click the **Properties** link in the details pane of the **File Integrity Monitor** node.
   The **Task settings** window opens.

---

File Integrity Monitor

437
4. In the window that opens, on the General tab, clear or select the Log information about file operations that appear during the monitor interruption period check box.

   The check box enables or disables monitoring of the file operations specified in the File Integrity Monitor task settings when the task is not running for any reason (removal of a hard disk, task stopped by user, software error).

   If the check box is selected, Kaspersky Security for Windows Server will record events in all monitoring scopes when the File Integrity Monitor task is not running.

   If the check box is cleared, the application will not log file operations in monitoring scopes when the task is not running.

   The check box is selected by default.

5. On the Schedule and Advanced tabs, configure the task start schedule (see Section “Managing task schedules” on page 134).

6. Click OK to save changes.

Configuring monitoring rules

You can change the default settings of the File Integrity Monitor task (see the table below).

<table>
<thead>

<td>You can configure the settings of scheduled startup of the task.</td>
</tr>
</tbody>
</table>

► *To add a monitoring scope, perform the following steps:*

1. In the Application Console tree, expand the **System Inspection** node.
2. Select the **File Integrity Monitor** child node.
3. Click the **File operations monitoring rules** link in the details pane of the **File Integrity Monitor** node. The **File operations monitoring** window opens.
4. Add a monitoring scope in one of the following ways:
   - If you want to select folders through the standard Microsoft Windows dialog:
     a. On the left side of the window, click the **Browse** button.
        The standard Microsoft Windows **Browse For Folder** window opens.
     b. In the window that opens, select the folder for which you want to monitor operations, and click the **OK** button.
     c. Click the **Add** button to have Kaspersky Security for Windows Server start monitoring file operations in the indicated monitoring scope.
   - If you want to specify a monitoring scope manually, add a path using a supported mask:
     - `<*.ext>` - all files with the extension `<ext>`, regardless of their location;
     - `<\name.ext>` - all files with name `<name>` and extension `<ext>`, regardless of their location;
     - `<\dir\>` - all files in folder `<\dir>`;
     - `<\dir\name.ext>` - all files with the name `<name>` and extension `<ext>` in folder `<\dir>` and all of its child folders.

When specifying a monitoring scope manually, be sure that the path is in the following format: `<volume letter>:\<mask>`. If the volume letter is missing, Kaspersky Security for Windows Server will not add the specified monitoring scope.

On the right side of the window, the **Rule description** tab displays the trusted users and file operation markers selected for this monitoring scope.

5. In the list of added monitoring scopes, select the scope whose settings you want to configure.
6. Select the **Trusted users** tab.
7. Click the **Add** button.
   The standard Microsoft Windows **Select Users or Groups** window opens.
8. Select the users or groups of users that Kaspersky Security for Windows Server will consider trusted for the selected monitoring scope.
9. Click **OK**.
By default, Kaspersky Security for Windows Server treats all users not on the trusted user list as untrusted (see Section "About file operation monitoring rules" on page 430), and generates Critical events for them.

10. Select the **Set file operations markers** tab.

11. If required, perform the following actions to select a number of markers:
   a. Select the **Detect file operations basing on the following markers** option.
   b. In the list of available file operations (see Section "About file operation monitoring rules" on page 430) select the check boxes next to the operations you want to monitor.

   By default Kaspersky Security for Windows Server detects all file operation markers, the **Detect file operations basing on all recognizable markers** option is selected.

12. If you want Kaspersky Security for Windows Server to calculate files checksum after operation is performed, do the following:
   a. In the **Checksum calculation** section select the **Calculate checksum for a file final version, after the file was changed, if possible** check box.

      If the check box is selected, Kaspersky Security for Windows Server calculates the checksum of the modified file, where the file operation with at least one selected marker was detected.

      If the file operation is detected by a number of markers, only the final file checksum after all modifications is calculated.

      If the check box is cleared, Kaspersky Security for Windows Server does not calculate the checksum for the modified files.

      No checksum calculation is performed in the following cases:
      - If the file became unavailable (for example, due to the change of access permissions).
      - If the file operation is detected in the file that has been removed afterwards.

      The check box is cleared by default.

   b. In the **Calculate the checksum using the algorithm** drop down list select one of the options:
      - **MD5 hash**.
      - **SHA256 hash**.

13. If necessary, add excluded monitoring scopes by performing the following steps:
   a. Select the **Set exclusions** tab.
   b. Select the **Consider excluded monitoring scope** check box.

      The check box disables use of exclusions for folders where file operations do not need to be monitored.

      If the check box is selected, Kaspersky Security for Windows Server skips the monitoring scopes specified in the exclusions list when the File Integrity Monitor task is run.
If the check box is cleared, Kaspersky Security for Windows Server logs events for all specified monitoring scopes.

By default, the check box is cleared and the exclusion list is empty.

c. Click the **Browse** button.
   The standard Microsoft Windows **Browse For Folder** window opens.

d. In the window that opens, specify the folder that you want to exclude from the monitoring scope.

e. Click **OK**.

f. Click the **Add** button.
   The specified folder is added to the list of excluded scopes.

You can also add excluded monitoring scopes manually using the same masks that are used to specify monitoring scopes.

14. Click the **Save** button to apply new rule configuration.
Log Inspection

This section contains information about the Log Inspection task and task settings.

About the Log Inspection task

When the Log Inspection task runs, Kaspersky Security for Windows Server monitors the integrity of the protected environment based on the results of an inspection of Windows Event Logs. The application notifies the administrator upon detecting abnormal behavior in the system, which may be an indication of attempted cyberattacks.

Kaspersky Security for Windows Server considers the Window event logs and identifies breaches based on the rules specified by a user or by the settings of the heuristic analyzer, which is used by the task to inspect logs.

Predefined rules and heuristic analysis

You can use the Log Inspection task to monitor the state of the protected system by applying the predefined rules, that are based on existing heuristics. The heuristic analyzer identifies abnormal activity on the protected server, which may be evidence of an attempted attack. Templates to identify abnormal behavior are included in the available rules in the predefined rules settings.

Seven rules are included in the rule list for the Log Inspection task. You can enable or disable the use of any of the rules. You cannot delete existing or create new rules.

You can configure the triggering criteria for rules that monitor events for the following operations:

- Password brute-force detection
- Network login detection

You can also configure exclusions in the task settings. The heuristic analyzer is not activated when a login is conducted by a trusted user or from a trusted IP address.

Kaspersky Security for Windows Server does not use heuristics to inspect Windows logs if the heuristic analyzer is not used by the task. By default, the heuristic analyzer is enabled.

When the rules are applied, the application records a Critical event in the Log Inspection task log.
Custom rules for the Log Inspection task

You can use the task rule settings to specify and change the criteria for triggering rules upon detecting the selected events in the specified Windows log. By default, the list of Log Inspection task rules contains four rules. You can enable and disable the use these rules, remove rules, and edit rule settings.

You can configure the following rule triggering criteria for each rule:

- List of record identifiers in the Windows Event Log.
  The rule is triggered when a new record is created in the Windows Event Log, if the event properties includes an event identifier specified for the rule. You can also add and remove identifiers for each specified rule.

- Event source.
  For each rule, you can define a sublog of the Windows Event Log. The application will search for records with the specified event identifiers only in this sublog. You can select one of the standard sublogs (Application, Security, or System), or specify a custom sublog by entering the name in the source selection field.

  The application does not verify that the specified sublog actually exists in the Windows Event Log.

When the rule is triggered, Kaspersky Security for Windows Server records a Critical event in the Log Inspection task log.

By default Log Inspection task applies custom rules.

Default Log Inspection task settings

By default, the Log Inspection task has the settings described in the table below. You can change the values of these settings.

<table>
<thead>
<tr>
<th>Setting</th>
<th>Default value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Apply custom rules for Log Inspection</td>

Adding Log inspection rules via the Administration Plug-in......................................................... 446

Managing the predefined task rules via the Administration Plug-in

► Perform the following actions to configure the predefined rules for the Log Inspection task:

1. Expand the Managed devices node in the Kaspersky Security Center Administration Console tree.
2. Select the administration group for which you want to configure application settings.
3. Perform one of the following actions in the details pane of the selected administration group:
   - To configure application settings for a group of servers, select the Policies tab and open the Properties: <Policy name> window (see Section “Configuring policy” on page 119).
   - To configure the application for a single server, select the Devices tab and open the Application settings window (see Section “Configuring local tasks in the Application settings window of the Kaspersky Security Center” on page 124).

   If an active Kaspersky Security Center policy is applied to a device, and this policy blocks changes to application settings, then these settings cannot be edited in the Application settings window.

4. In the System Inspection section click the Settings button in the Log Inspection block. The Log Inspection window opens.

<table>
<thead>
<tr>
<th>Setting</th>
<th>Default value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Network logon</td>
<td>12:00:00 AM.</td>
<td>You can indicate the start and end of the time interval during which Kaspersky Security for Windows Server treats sign-in attempts as abnormal activity.</td>
</tr>
<tr>
<td>Exclusions</td>
<td>Not applied.</td>
<td>You can specify users and IP addresses which will not trigger heuristic analyzer.</td>
</tr>
<tr>
<td>Task start schedule</td>
<td>First run is not scheduled.</td>
<td>You can configure the settings of scheduled startup of the task.</td>
</tr>
</tbody>
</table>
5. Select the **Predefined rules** tab.

6. Select or clear check box **Apply custom rules for log inspection**.

   If this check box is selected, Kaspersky Security for Windows Server applies heuristic analyzer to detect abnormal activity on the protected server.

   If this check box is cleared the heuristic analyzer is not running and Kaspersky Security for Windows Server applies preset or custom rules to detect abnormal activity.

   The check box is selected by default.

   For the task to run, at least one Log Inspection rule must be selected.

7. Select the rules which you want to apply from the list of predefined rules:
   - There are patterns of a possible brute-force attack in the system.
   - There are patterns of a possible Windows Event log abuse.
   - Atypical actions detected on behalf of a new service installed.
   - Atypical logon that uses explicit credentials detected.
   - There are patterns of a possible Kerberos forged PAC (MS14-068) attack in the system.
   - Atypical actions detected directed at a privileged built-in group Administrators.
   - There is an atypical activity detected during a network logon session.

8. To configure the selected rules, click the **Advanced settings** button.

   The Log Inspection window opens.

9. In the **Brute-force attack detection** section set the number of attempts and a time frame when these attempts occurred, which will be considered as triggers for heuristic analyzer.

10. In the **Network logon detection** section, indicate the start and end of the time interval during which Kaspersky Security for Windows Server treats sign-in attempts as abnormal activity.

11. Select the **Exclusions** tab.

12. Perform the following actions to add trusted users:
   a. Click the **Browse** button.
   b. Select a user.
   c. Click **OK**.

      A selected user is added to the list of trusted users.

13. Perform the following actions to add trusted IP-addresses:
   a. Enter the IP-address.
   b. Click the **Add** button.

14. An entered IP-address is added to the list of trusted IP-addresses.

15. On the **Task management** tab configure the task start schedule (see Section "Configuring the task start schedule settings" on page 134).

16. Click **OK**.

   The Log Inspection task configuration is saved.
Adding Log inspection rules via the Administration Plug-in

1. Expand the Managed devices node in the Kaspersky Security Center Administration Console tree.
2. Select the administration group for which you want to configure application settings.
3. Perform one of the following actions in the details pane of the selected administration group:
   - To configure application settings for a group of servers, select the Policies tab and open the Properties: <Policy name> window (see Section “Configuring policy” on page 119).
   - To configure the application for a single server, select the Devices tab and open the Application settings window (see Section “Configuring local tasks in the Application settings window of the Kaspersky Security Center” on page 124).

4. In the System Inspection section click the Settings button in the Log Inspection block.
   The Log Inspection window opens.
5. On the Custom rules tab select or clear the Apply custom rules for log inspection check box.
   If the check box is selected, Kaspersky Security for Windows Server applies custom rules for Log Inspection according to each rule settings. You can add, remove or configure Log Inspection rules.
   If the check box is cleared, you cannot add or modify the custom rules. Kaspersky Security for Windows Server applies default rules settings.
   The check box is selected by default. Only the Application popup detection rule is active.
6. To add a new custom rule, click the Add button.
   The Log inspection rules window opens.
7. In the General section enter the following information about the new rule:
   - Rule name
   - Source
     Select a source log to use recorded events for analysis. The following Windows event log types are available:
     - Application
     - Security
     - System
     You can add a new custom log by entering the log name into the Source field.
8. In the Triggered events ID section specify the item IDs that will trigger the rule on detection:
Managing Log inspection rules via the Application Console

In this section, learn how to add and configure Log inspection rules via the Application Console.

In this section

Managing the predefined task rules via the Application Console ........................................................... 447
Configuring the Log inspection rules ........................................................................................................ 448

Managing the predefined task rules via the Application Console

► Perform the following actions to configure the heuristic analyzer for the Log Inspection task:

1. In the Application Console tree, expand the System Inspection node.
2. Select the Log Inspection child node.
3. Click the Properties link in the details pane of the Log Inspection node.
   The Task settings window opens.
4. Select the Predefined rules tab.
5. Select or clear check box Apply custom rules for log inspection.
   If this check box is selected, Kaspersky Security for Windows Server applies heuristic analyzer to detect abnormal activity on the protected server.
   If this check box is cleared the heuristic analyzer is not running and Kaspersky Security for Windows Server applies preset or custom rules to detect abnormal activity.
   The check box is selected by default.

For the task to run, at least one Log Inspection rule must be selected.

6. Select the rules which you want to apply from the list of predefined rules:
   • There are patterns of a possible brute-force attack in the system.
   • There are patterns of a possible Windows Event log abuse.
   • Atypical actions detected on behalf of a new service installed.
   • Atypical logon that uses explicit credentials detected.
- There are patterns of a possible Kerberos forged PAC (MS14-068) attack in the system.
- Atypical actions detected directed at a privileged built-in group Administrators.
- There is an atypical activity detected during a network logon session.

7. To configure the selected rules, go to the **Extended** tab.

8. In the **Brute-force attack detection** set the number of attempts and a time frame when these attempts occurred, which will be considered as triggers for heuristic analysis.

9. In the **Network logon** section, indicate the start and end of the time interval during which Kaspersky Security for Windows Server treats sign-in attempts as abnormal activity.

10. Select the **Exclusions** tab.

11. Perform the following actions to add trusted users:
    - a. Click the **Browse** button.
    - b. Select a user.
    - c. Click **OK**.
      
      A selected user is added to the list of trusted users.

12. Perform the following actions to add trusted IP-addresses:
    - a. Enter the IP-address.
    - b. Click the **Add** button.
      
      An entered IP-address is added to the list of trusted IP-addresses.

13. Select the **Schedule** and **Advanced** tabs to configure the task start schedule.

14. Click **OK**.

The Log Inspection task configuration is saved.

**Configuring the Log inspection rules**

Perform the following actions to add and configure a new Log Inspection custom rule:

1. In the Application Console tree, expand the **System Inspection** node.

2. Select the **Log Inspection** child node.

3. In the details pane of the **Log Inspection** node, click the **Log inspection rules** link.

   The **Log inspection rules** window opens.

4. Select or clear the **Apply custom rules for log inspection** check box.
   
   If the check box is selected, Kaspersky Security for Windows Server applies custom rules for Log Inspection according to each rule settings. You can add, remove or configure Log Inspection rules.
   
   If the check box is cleared, you cannot add or modify the custom rules. Kaspersky Security for Windows Server applies default rules settings.
   
   The check box is selected by default. Only the Application popup detection rule is active.
You can control whether the predefined rules are applied for the Log Inspection task. Select the check boxes corresponding to the rules you want to apply for the Log Inspection.

5. To create a new custom rule, do the following:
   a. Enter the name of the new rule.
   b. Click the Add button.
      The created rule is added to the general rule list.

6. To configure any rule, take the following steps:
   a. Click with the left mouse button to select a rule in the list.
      In the right area of the window, the Description tab displays general information about the rule.
      The description for the new rule is blank.
   b. Select the Rule description tab.
   c. In the General section, edit the rule name, if necessary.
   d. Select the Source.

7. In the Event identifiers section specify the item IDs that will trigger the rule on detection:
   a. Enter an ID’s numeric value.
   b. Click the Add button.
      A selected rule ID is added to the list. You can add an unlimited number of identifiers for each rule.
   c. Click the Save button.
      The configured log inspection rules will be applied.
On-Demand Scan

This section provides information about On-Demand Scan tasks, and instructions on configuring On-Demand Scan task settings and security settings on the protected server.

About On-Demand Scan tasks

Kaspersky Security for Windows Server provides following system tasks of On-Demand Scan:

- The Scan at Operating System Startup task is performed every time Kaspersky Security for Windows Server starts. Kaspersky Security for Windows Server scans boot sectors and master boot records of hard and removable drives, system memory, and memory of processes. Every time Kaspersky Security for Windows Server runs the task, it creates a copy of non-infected boot sectors. If at the next task start it detects a threat in those sectors, it replaces them with the backup copy.

- By default, the Critical Areas Scan task is performed weekly by schedule. Kaspersky Security for Windows Server scans objects in critical areas of the operating system: autorun objects, boot sectors and master boot records of hard and removable drives, system memory and memory of processes. Application scans files in the system folders, for example, in %windir%\system32. Kaspersky Security for Windows Server applies security settings the values of which correspond to the Recommended level (see Section "About predefined security levels for On-Demand Scan tasks" on page 455). You can modify the settings of the Critical Areas Scan task.

- Quarantine Scan task is executed by default according to the schedule after every databases update. The Quarantine Scan task scope cannot be modified.
The Application Integrity Control task is performed daily. It provides the option of checking Kaspersky Security for Windows Server modules for damage or modification. The application installation folder is checked. The task execution statistics contain information about the number of modules checked and corrupted. The values of the task settings are defined by default and cannot be edited. The task start schedule settings can be edited.

Additionally you can create custom On-Demand Scan tasks, for example, a task for scanning shared folders on the server.

Kaspersky Security for Windows Server may run several On-Demand Scan tasks at the same time.

**About scan scope**

You can configure the scan scope for Scan at Operating System Startup and Critical Areas Scan tasks, and for custom On-Demand Scan tasks.

By default On-Demand Scan tasks scan all objects of the server file system. If there is no security requirement to scan all objects of the file system, you can limit the scan to the scan scope.

In the Application Console, the scan scope is displayed as a tree or as a list of the server file resources that Kaspersky Security for Windows Server can control. By default, the network file resources of the protected server are displayed in a list-view mode.

► *To display network file resources in the tree-view mode,*

open the drop-down list in the **Scan scope settings** window upper left sector and select **Tree-view**.

The nodes are displayed in a list-view or in a tree-view mode of the server file resources as follows:

☑ The node is included in the scan scope.

☐ The node is excluded from the scan scope.

☑ At least one of the child nodes of this node is excluded from the scan scope, or the security settings of the child node(s) differ from those of this node (only for tree-view mode).

The **☑** icon is displayed if all child nodes are selected, but the parent node is not selected. In this case, changes in the composition of files and folders of the parent node are disregarded automatically when the scan scope for the selected child node is being modified.

The names of virtual nodes in the scan scope are displayed in blue font.
Predefined scan scopes

The tree or list of computer file resources for the selected On-Demand Scan task is displayed on the Scan scope settings tab.

- The file resources tree or list displays the nodes to which you have read-access based on the configured security settings of Microsoft Windows.

Kaspersky Security for Windows Server contains the following predefined scan scopes:

- **My Computer.** Kaspersky Security for Windows Server scans the entire server.

- **Local hard drives.** Kaspersky Security for Windows Server scans objects on a server hard drives. All hard drives, individual disks, folders or files can be included in or excluded from the scan scope.

- **Removable drives.** Kaspersky Security for Windows Server scans files on external devices, such as CDs or USB drives. All removable disks, individual disks, folders or files can be included in or excluded from the scan scope.

- **Network.** Network folders or files can be added to the scan scope by specifying their path in UNC (Universal Naming Convention) format. The account used to start the task must have access permissions for the network folders and files added. By default On-Demand Scan tasks run under the system account.

  Connected network drives will also not be displayed in the server file resources tree. To include objects on network drives in the scan scope, specify the path to the folder which corresponds to this network drive in UNC format.

- **System memory.** Kaspersky Security for Windows Server scans the executable files and modules of the processes running in the operating system when the scan is initiated.

- **Startup objects.** Kaspersky Security for Windows Server scans objects to which registry keys and configuration files refer, for example WIN.INI or SYSTEM.INI, as well as the application's modules that are started automatically at computer startup.

- **Shared folders.** You can include shared folders on the protected server into the scan scope.

- **Virtual drives.** Dynamic folders and files and drives that are connected to the server can be included in the scan scope, for example, common cluster drives.

  Virtual drives created using a SUBST command are not displayed in the server file resource tree in the Application Console. In order to scan objects on a virtual drive, include the server folder with which this virtual drive is associated into the scan scope.

By default, you can view and configure predefined scan scopes in the network file resources tree; you can also add predefined scopes to the network file resources list during its formation in the scan scope settings.
By default, On-Demand Scan tasks are run under the following scopes:

- **Scan at Operating System Startup task:**
  - Local hard drives
  - Removable drives
  - System memory
- **Critical Areas Scan:**
  - Local hard drives (excluding Windows folders)
  - Removable drives
  - System memory
  - Startup objects
- **Other tasks:**
  - Local hard drives (excluding Windows folders)
  - Removable drives
  - System memory
  - Startup objects
  - Shared folders

### Cloud storage file scanning

**About cloud files**

Kaspersky Security for Windows Server can interact with Microsoft OneDrive cloud files. The application supports the new OneDrive Files On-Demand feature.

Kaspersky Security for Windows Server does not support other cloud storages.

OneDrive Files On-Demand helps you access all your files in OneDrive without having to download all of them and use storage space on your device. You can download files to your hard drive when you need to.

When the OneDrive Files On-Demand feature is on, you see status icons next to each file in the **Status** column in File Explorer. Each file has one of the following statuses:

- ☁️ This status icon indicates that the file is *only available online*. Online-only files are not physically stored on your hard drive. You can’t open online-only files when your device is not connected to the Internet.

- ✂️ This status icon indicates that a file is *locally available*. This happens when you open an online-only file and it downloads to your device. You can open a locally available file anytime, even without Internet access. To clear up space you can change the file back to ☁️ online-only.

- 💼 This status icon indicates that a file is *stored on your hard drive and is always available*. 
Cloud file scanning
Kaspersky Security for Windows Server can only scan cloud files that are stored locally on a protected server. Such OneDrive files have the ☐️ and ☐️ statuses. The ☐️ files are skipped during scanning, since they are not physically located on the protected server.

Kaspersky Security for Windows Server does not automatically download ☐️ files from the cloud during the scanning, even if they are included in the scan scope.

Cloud files are processed by several Kaspersky Security for Windows Server tasks in various scenarios depending on the task type:

- **Real-time cloud files scanning**: you can add folders containing cloud files to the Real-Time File Protection task protection scope. The file is scanned when it is accessed by the user. If a ☐️ file is accessed by the user, it is downloaded, becomes locally available, and its status changes to ☐️. This allows the file to be processed by the Real-Time File Protection task.

- **On-demand cloud file scanning**: you can add folders containing cloud files to the On-Demand Scan task's scan scope. The task scans files with the ☐️ and ☐️ statuses. If any ☐️ files are found in the scope, they will be skipped during scanning and an informational event will be recorded in the task log, indicating that the scanned file is only a placeholder for a cloud file and does not exist on a local drive.

- **Application Control rule generation and usage**: you can create allowing and denying rules for ☐️ and ☐️ files using the Rule Generator for Applications Launch Control task. The Applications Launch Control task applies the Default Deny principle and created rules to process and block cloud files.

The Applications Launch Control task blocks the start of all cloud files, irrespective of their status. The ☐️ files are not included in the rule generation scope by the application, as they are not physically stored on a hard drive. Since no allowing rules cannot be created for such files, they are subject to the Default Deny principle.

When a threat is detected in a OneDrive cloud file, the application applies the action specified in the settings of the task performing the scanning. In this way, the file can be removed, disinfected, moved to quarantine, or backed up.

Changes to local files are synchronized with the copies stored on OneDrive in accordance with the principles outlined in the relevant Microsoft OneDrive documentation.
Security settings of selected node in On-Demand Scan tasks

In the selected On-Demand Scan task, the default values of security settings can be modified by configuring them as common settings for the entire protection or scan scope, or as different settings for different nodes or items in the server file resource tree or list.

Security settings configured for the selected parent node are automatically applied to all child nodes. The security settings of the parent node are not applied to child nodes that are configured separately.

The settings for a selected scan scope or protection scope can be configured using one of the following methods:

- Select one of three predefined security levels (Maximum performance, Recommended, or Maximum protection).
- Manually change the security settings for the selected nodes or items in the tree or in the list of the server's file resources (the security level changes to Custom).

A set of node settings can be saved in a template in order to be applied later to other nodes.

About predefined security levels for On-Demand Scan tasks

One of three predefined security levels for a node selected in the server file resources tree can be applied: Maximum performance, Recommended, and Maximum protection. Each of these levels contains its own predefined set of security settings (see the table below).

Maximum performance

The Maximum performance security level is recommended if, beyond using Kaspersky Security for Windows Server on servers and work stations, there are additional server security measures inside your network, for example, firewalls and existing security policies.

Recommended

The Recommended security level ensures an optimum combination of protection and performance impact on protected servers. This level is recommended by Kaspersky Lab experts as sufficient to protect servers on most corporate networks. The Recommended security level is set by default.

Maximum protection

The Maximum protection security level is recommended if your organization’s network has elevated computer security requirements.

* New and modified objects only
About the Removable Drives Scan

You can configure scanning of removable drives connected to the protected server via the USB port.

Kaspersky Security for Windows Server scans a removable drive using the On-Demand Scan task. The application automatically creates a new On-Demand Scan task when the removable drive is connected and deletes the task after the scanning is completed. The created task is performed with the predefined security level defined for removable drive scanning. You cannot configure the settings of the temporary On-Demand Scan task.

If you installed Kaspersky Security for Windows Server without anti-virus databases, the removable drives scan will be unavailable.

Kaspersky Security for Windows Server scans connected removable USB drives when they are registered as USB mass storage devices in the operating system. The application does not scan a removable drive if the connection is blocked by the Device Control task. The application does not scan MTP-connected mobile devices.

Kaspersky Security for Windows Server allows access to removable drives during scanning.

Scan results for each removable drive are available in the log for the On-Demand Scan task created upon connection of the removable drive.

You can change the settings of the Removable Drives Scan component (see the table below).

<table>
<thead>
<tr>
<th>Setting</th>
<th>Default Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

Opening the On-Demand Scan task Wizard

To start creating a new custom On-Demand Scan task:

1. To create a local task:
   a. Expand the Managed devices node in the Kaspersky Security Center Administration Console.
   b. Select the administration group that the server belongs to.
   c. In the details pane, on the Devices tab open the context menu for the protected server.
   d. Select the Properties menu option.
   e. In the window that opens, click the Add button in the Tasks section.

The New Task Wizard window opens.

2. To create a group task:
   a. Expand the Managed devices node in the Kaspersky Security Center Administration Console tree.
   b. Select the administration group for which you want to create a task.
c. Open the **Tasks** tab.

d. Click the **Create a task** button.

The **New Task Wizard** window opens.

3. To create a task for a custom set of servers:
   
a. In the **Device selections** node in the Kaspersky Security Center Administration Console tree, click the **Run selection** button to perform a device selection.
   
b. Open the **Selection results "selection name"** tab.
   
c. In the **Perform selection** drop-down list, select the **Create a task for a selection result** option.

The **New Task Wizard** window opens.

4. Select the **On-Demand Scan** task in the list of available tasks for Kaspersky Security for Windows Server.

5. Click **Next**.

The **Settings** window opens.

Configure the task settings as required.

**To configure an existing On-Demand Scan task,**

double-click the task name in the list of Kaspersky Security Center tasks.

The **Properties: On-Demand Scan** window opens.

**Opening the On-Demand Scan task properties**

**To open the application properties for the On-Demand Scan task for a single server:**

1. Expand the **Managed devices** node in the Kaspersky Security Center Administration Console tree.
2. Select the administration group that the protected server belongs to.
3. Select the **Devices** tab.
4. Double-click the name of the server for which you want to configure the scan scope.

   The **Properties: server name** window opens.

5. Select the **Tasks** section.
6. In the list of tasks created for the device select the On-Demand Scan task that you created.
7. Click the **Properties** button.

   The **Properties: On-Demand Scan** window opens.

Configure the task settings as required.
Creating an On-Demand Scan task

To create a custom On-Demand Scan task:

1. Open the **Settings** (see Section "Opening the On-Demand Scan task Wizard" on page 460) window in the **New Task Wizard**.
2. Select the required **Task creation method**.
3. Click **Next**.
4. Create a scan scope in the **Scan scope** window:

   By default, scan scope includes critical areas of the server. Scan scopes are marked in the table with the icon [ ]. Excluded scan scopes are marked with the [ ] icon in the table. You can change the scan scope: add specific preset scan scopes, disks, folders, network objects and files and assign specific security settings for each scope added.

   - To exclude all critical areas from the scan, open the context menu on each of the lines and select the **Remove scope** option.
   - To include a predefined scan scope, disk, folder, network object, or file in the scan scope:
     a. Right-click the **Scan scope** table and select **Add scope** or click the **Add** button.
     b. In the **Add objects to the scan scope** window, select the predefined scope in the **Predefined scope** list, specify the computer drive, folder, network object, or file on the server or on another network computer, and click the **OK** button.
   - To exclude subfolders or files from the scan, select the added folder (disk) in the **Scan scope** window of the wizard:
     a. Open the context menu and select the **Configure** option.
     b. Click the **Settings** button in the **Security level** window.
     c. On the **General** tab in the **On-demand scan settings** window clear the **Subfolders** and **Subfiles** check boxes.
   - To change scan scope security settings:
     a. Open the context menu on the scope whose settings you wish to configure, and select **Configure**.
     b. In the **On-demand scan settings** window, select one of the predefined security levels, or click the **Settings** button to configure security settings manually.

Security settings are configured the same way as for the Real-Time File Protection task (see Section "Configuring security settings manually" on page 252).

   - To skip embedded objects in the added scan scope:
     a. Open the context menu on the **Scan scope** table, select **Add exclusion**.
     b. Specify the objects to exclude: select predefined scope in the **Predefined scope** list, specify the computer disk, folder, network object, or file on the server or on another network computer.
     c. Click the **OK** button.
5. In the **Options** window, configure the heuristic analyzer and integration with other components:

- **Configure the usage of heuristic analyzer** (see Section "Configuring Heuristic Analyzer and integration with other application components" on page 248).

- **Select the Apply Trusted Zone check box**, if you want to exclude objects added to the Trusted Zone list from the scan scope of the task.
  
  This check box enables / disables use of the Trusted Zone for a task.
  
  If the check box is selected, Kaspersky Security for Windows Server adds file operations of trusted processes to the scan exclusions configured in the task settings.
  
  If the check box is cleared, Kaspersky Security for Windows Server disregards the file operations of trusted processes when forming the protection scope for the task.

  The check box is selected by default.

- **Select the Use KSN for scanning check box**, if you want to use Kaspersky Security Network cloud services for the task.
  
  This check box enables / disables the use of Kaspersky Security Network (KSN) cloud services in the task.
  
  If the check box is selected, the application uses data received from KSN services to ensure a faster response time by the application to new threats and reduce the likelihood of false positives.
  
  If the check box is cleared, the On-Demand Scan task does not use KSN services.

  The check box is selected by default.

- **To assign the base priority **Low** to the working process in which the task will be executed, select the Perform task in background mode check box in the **Options** window.**

  The check box modifies the priority of the task.

  If the check box is selected, the task priority in the operating system is reduced. The operating system provides resources for performing the task depending on the load on the CPU and the server file system from other Kaspersky Security for Windows Server tasks and other applications. As a result, task performance will slow down during increased loads and will speed up at lower loads.

  If the check box is cleared, the task will start and run with the same priority as the other Kaspersky Security for Windows Server tasks and other applications. In this case, the speed of task execution increases.

  The check box is cleared by default.

**By default, the working processes in which Kaspersky Security for Windows Server tasks are run have the **Medium** (Normal) priority.**
To use the created task as a Critical Areas Scan task, select the **Consider task as critical areas scan** check box in the **Options** window.

The check box changes the task priority: enables or disables logging of the **Critical Areas Scan** event and refreshing of the server protection status. Kaspersky Security Center evaluates the security rating of the server (servers) by the performance results of tasks with the **Critical Areas Scan** status. The check box is not available in the properties of local system and custom tasks of Kaspersky Security for Windows Server. You can edit this setting only on the side of Kaspersky Security Center.

If this check box is selected, Administration Server logs the Critical Areas Scan completion and refreshes the server protection status based on the task execution results. The scan task has a high priority.

If the check box is cleared, the task is run with a low priority.

The check box is cleared by default for custom On-demand tasks.

6. Click **Next**.

7. In the **Schedule** window, set the scheduled task start settings.

8. Click **Next**.

9. In the **Selecting an account to run the task** window, specify the account you want to use.

10. Click **Next**.

11. Define a task name.

12. Click **Next**.

   The task name should be no longer than 100 characters and cannot contain the following symbols: "* < > & \ : |"

   The **Finish task creation** window opens.

13. You can optionally run the task after the Wizard finishes by selecting the **Run task after Wizard finishes** check box.

14. Click **Finish** to finish creating the task.

   The new On-Demand Scan task will be created for a selected server or a group of servers.

---

**In this section**

- Assigning the Critical Areas Scan task status to an On-Demand Scan task ......................................... 464
- Running background On-Demand Scan task ............................................................................................... 465
- Registering execution of Critical Areas Scan ............................................................................................. 466

---

**Assigning the Critical Areas Scan task status to an On-Demand Scan task**

By default, Kaspersky Security Center assigns the **Warning** status to the server if the Critical Areas Scan task is performed less often than specified by the **Critical areas scan has not been performed for a long time** event generation threshold setting of Kaspersky Security for Windows Server.
To configure scanning of all servers in a single administration group, take the following steps:

1. Create a group On-Demand Scan task (see Section "Creating an On-Demand Scan task" on page 462).
2. In the Options window of the task wizard, select the Consider task as critical areas scan check box. The task settings specified (the scan scope and security settings) will be applied to all servers in the group. Configure the task schedule.

You can select the Consider task as critical areas scan check box when creating the On-Demand Scan task for a group of servers or later in the Properties: <Task name> window (see Section "Opening the On-Demand Scan task properties" on page 461).

3. Using a new or existing policy disable the scheduled start of system on-demand scan tasks (see Section "Configuring scheduled start of local system tasks" on page 102) on the group servers. Kaspersky Security Center Administration Server will then evaluate the security status of the protected server and will notify you about it based on the results of the last run of the task with the Critical Areas Scan status, rather than based on the results of the Critical Areas Scan system task.

You can assign the Critical Areas Scan task status both to group On-Demand Scan tasks and to tasks for sets of computers.

The Application Console can be used to view whether the On-Demand Scan task is a Critical Areas Scan task.

In the Application Console, the Consider task as critical areas scan check box is displayed in task properties but cannot be edited.

Running background On-Demand Scan task

By default the processes in which Kaspersky Security for Windows Server tasks are executed are assigned the base priority Medium (Normal).

The process that will run an On-Demand Scan task can be assigned Low priority. Demoting the process priority increases the time required to execute the task, but may have a beneficial effect on the execution speed of the processes of other active programs.

Multiple background tasks can be running in a single working process with low priority. You can specify the maximum number of processes to background On-Demand Scan tasks.

To change the priority of an existing On-Demand Scan task:

1. Open the Properties: On-Demand Scan window (see Section "Opening the On-Demand Scan task Wizard" on page 460).
2. Select or clear the Perform task in background mode check box.

The check box modifies the priority of the task.

If the check box is selected, the task priority in the operating system is reduced. The operating system provides resources for performing the task depending on the load on the CPU and the server file system from other Kaspersky Security for Windows Server tasks and other applications. As a result, task performance will slow down during increased loads and will speed up at lower loads.
If the check box is cleared, the task will start and run with the same priority as the other Kaspersky Security for Windows Server tasks and other applications. In this case, the speed of task execution increases. The check box is cleared by default.

3. Click **OK**.

Configured task settings are saved and applied immediately to the running task. If the task is not running, the modified settings are applied at next start.

### Registering execution of Critical Areas Scan

By default, the server protection status is displayed in the details pane of the **Kaspersky Security** node and is updated weekly after the Critical Areas Scan task is performed.

The time of the server protection status update is linked to the schedule of the On-Demand task in whose settings the **Consider task as critical areas scan** check box is selected. By default, the check box is selected only for the Critical Areas Scan task and cannot be modified for this task.

You can select the On-Demand Scan task linked to the server’s protection status only from Kaspersky Security Center.

### Configuring the task scan scope

If you modify the scan scope in the Scan at Operating System Startup and Critical Areas Scan tasks, you can restore the default scan scope in these tasks by restoring Kaspersky Security for Windows Server itself (**Start** > **Programs** > **Kaspersky Security for Windows Server** > **Modify or Remove Kaspersky Security for Windows Server**). In the setup wizard, select **Repair installed components** and click **Next**, and then select the **Restore recommended application settings** check box.

**To configure a scan scope for an existing On-Demand Scan task:**

1. Open the **Properties: On-Demand Scan** window (see Section "Opening the On-Demand Scan task properties“ on page 461).
2. Select the **Scan scope** tab.
3. To include items in the scan scope:
   a. Open the context menu in the empty space of the scan scope list.
   b. Select the **Add scope** context menu option.
   c. In the opened **Add objects to the scan scope** window select an object type that you want to add:
      - **Predefined scope** to add one of the predefined scopes on a protected server. Then in the drop down list select a necessary scan scope.
      - **Disk, folder or network location** to include individual drive, folder or a network object into a scan scope. Then select a necessary scope by clicking the **Browse** button.
      - **File** to include an individual file into scan scope. Then select a necessary scope by clicking the **Browse** button.
4. To exclude individual nodes from the scan scope, clear the check boxes next to the names of these nodes or take the following steps:
   a. Open the context menu on the scan scope by right-clicking it.
   b. In the context menu select **Add exclusion** option.
   c. In the **Add exclusion** window select an object type that you want to add as an exclusion out of the scan scope following the logic of the adding object to a scan scope procedure.
5. To modify the scan scope or an exclusion added, select the **Edit scope** option in the context menu for the necessary scan scope.
6. To hide the previously added scan scope or an exclusion in the list of network file resources, select the **Remove scope** option in the context menu for the necessary scan scope.

   The scan scope is excluded out of the On-demand scan task scope on its removal from the network file resources list.

7. Click the **OK** button.

   Scan scope settings window will be closed. Your newly configured settings have been saved.

### Selecting predefined security levels for On-Demand Scan tasks

One of three predefined security levels for an item selected in the list of the server network file resources can be applied: **Maximum performance**, **Recommended**, and **Maximum protection**.

▶ **To select one of the predefined security levels:**

1. Open the **Properties: On-Demand Scan** (see Section "Opening the On-Demand Scan task properties" on page 461) window.
2. Select the **Scan scope** tab.
3. In the list of the server select an item included in the scan scope to set the predefined security level.
4. Click the **Configure** button.
   The **On-demand scan settings** window opens.
5. On the **Security level** tab select the security level to be applied.
   The window displays the list of security settings corresponding to the security level selected.
6. Click the **OK** button.
7. Click the **OK** button in the **Properties: On-Demand Scan** window.
   Configured task settings are saved and applied immediately to the running task. If the task is not running, the modified settings are applied at next start.
Configuring security settings manually

By default On-Demand Scan tasks use common security settings for the entire scan scope. These settings correspond to the Recommended predefined security level (see Section "Predefined security levels" on page 240). The default values of security settings can be modified by configuring them as common settings for the entire protection scope or as different settings for different items in the server file resource list or nodes in the tree.

To configure security settings manually:

1. Open the Properties: On-Demand Scan window (see Section "Opening the On-Demand Scan task properties" on page 461).
2. Select the Scan scope tab.
3. Select the items in the scan scope list for which you want to configure security settings.

A predefined template containing security settings (see Section "About security settings templates" on page 159) can be applied for a selected node or item in the scan scope.

4. Click the Configure button.

The On-demand scan settings window opens.

5. Configure the required security settings of the selected node or item in accordance with your requirements:
   - General settings (see Section "Configuring general task settings" on page 468)
   - Actions (see Section "Configuring actions" on page 471)
   - Performance (see Section "Configuring performance" on page 473)

6. Click OK in the On-demand scan settings window.
7. Click OK in the Scan scope window.

New scan scope settings are saved.

In this section

| Configuring general task settings | .......................................................... | 468 |
| Configuring actions               | ...................................................................... | 471 |
| Configuring performance           | ...................................................................... | 473 |

Configuring general task settings

To configure general On-Demand Scan task settings:

1. Open the Properties: On-Demand Scan (see Section "Opening the On-Demand Scan task properties" on page 461) window.
2. Select the Scan scope tab.
3. Click the **Configure** button.
   The **On-demand scan settings** window opens.

4. Click the **Settings** button.

5. On the **General** tab, in the **Scan objects** section, specify the object types that you want to include in the scan scope:
   - **Objects to scan**
     - **All objects**
       Kaspersky Security for Windows Server scans all objects.
     - **Objects scanned by format**
       Kaspersky Security for Windows Server scans only infectable objects based on file format.
       Kaspersky Lab compiles the list of formats. It is included in the Kaspersky Security for Windows Server databases.
     - **Objects scanned according to list of extensions specified in anti-virus database**
       Kaspersky Security for Windows Server scans only infectable objects based on file extension.
       Kaspersky Lab compiles the list of extensions. It is included in the Kaspersky Security for Windows Server databases.
     - **Objects scanned by specified list of extensions**
       Kaspersky Security for Windows Server scans files based on file extension. List of file extensions can be manually customized in the **List of extensions** window, which can be opened by clicking the **Edit** button.
   - **Subfolders**
   - **Subfiles**
   - **Scan disk boot sectors and MBR**
     Enables protection of boot sectors and master boot records.
     If the check box is selected, Kaspersky Security for Windows Server scans boot sectors and master boot records on hard drives and removable drives of the server.
     The check box is selected by default.
   - **Scan alternate NTFS streams**
     Scanning of alternative file and folder streams on the NTFS file system drives.
     If the check box is selected, the application scans a probably infected object and all NTFS streams associated with that object.
     If the check box is cleared, the application scans only the object that was detected and considered as probably infected.
     The check box is selected by default.

6. In the **Performance** section, select or clear the **Scan only new and modified files** check box.
   This check box enables / disables scanning and protection of files that have been recognized by Kaspersky Security for Windows Server as new or modified since the last scan.
If the check box is selected, Kaspersky Security for Windows Server scans and protects only the files that it has recognized as new or modified since the last scan.

If the check box is cleared, you can select if you want to scan and protect only new files or all files disregarding their modification status.

By default, the check box is selected for the **Maximum performance** security level. If the **Maximum protection** or **Recommended** security levels are set, the check box is cleared.

To switch between available options when the check box is cleared, click on the **All / Only new** link for each of the compound object types.

7. In the **Scan of compound objects** section, specify the compound objects that you want to include in the scan scope:

   - **All / Only new archives**
     Scanning of ZIP, CAB, RAR, ARJ archives and other archive formats.
     If this check box is selected, Kaspersky Security for Windows Server scans archives.
     If this check box is cleared, Kaspersky Security for Windows Server skips archives during scanning.
     The default value depends on the selected protection level.

   - **All / Only new SFX archives**
     Scanning of self-extracting archives.
     If this check box is selected, Kaspersky Security for Windows Server scans SFX archives.
     If this check box is cleared, Kaspersky Security for Windows Server skips SFX archives during scanning.
     The default value depends on the selected protection level.
     This option is active when the **Archives** check box is cleared.

   - **All / Only new email databases**
     Scanning of Microsoft Outlook and Microsoft Outlook Express mail database files.
     If this check box is selected, Kaspersky Security for Windows Server scans mail database files.
     If this check box is cleared, Kaspersky Security for Windows Server skips mail database files during scanning.
     The default value depends on the selected security level.

   - **All / Only new packed objects**
     Scanning of executable files packed by binary code packers, such as UPX or ASPack.
     If this check box is selected, Kaspersky Security for Windows Server scans executable files packed by packers.
     If this check box is cleared, Kaspersky Security for Windows Server skips executable files packed by packers during scanning.
     The default value depends on the selected protection level.
• **All / Only new plain email**
  Scanning of files of mail formats, such as Microsoft Outlook and Microsoft Outlook Express messages.
  
  If this check box is selected, Kaspersky Security for Windows Server scans files of mail formats.
  
  If this check box is cleared, Kaspersky Security for Windows Server skips files of mail formats during scanning.
  
  The default value depends on the selected security level.

• **All / Only new embedded OLE objects**
  Scanning of objects embedded into files (such as Microsoft Word macros, or email message attachments).
  
  If this check box is selected, Kaspersky Security for Windows Server scans objects embedded into files.
  
  If this check box is cleared, Kaspersky Security for Windows Server skips objects embedded into files during scanning.
  
  The default value depends on the selected protection level.

8. Click **OK**.

   New task configuration will be saved.

**Configuring actions**

► **To configure actions on infected and other detected objects during the On-Demand Scan task execution**:

1. Open the **Properties: On-Demand Scan** (see Section “Opening the On-Demand Scan task properties” on page 461) window.

2. Select the **Scan scope** tab.

3. Click the **Configure** button.

   The **On-demand scan settings** window opens.

4. Click the **Settings** button.

5. Select the **Actions** tab.

6. Select the action to be performed on infected and other detected objects:

   • **Notify only**.

   When this mode is selected, Kaspersky Security for Windows Server does not block access to detected or other detected objects, or perform any actions on them. The following event is registered in the task log: *Object not disinfected. Reason: no action was taken to neutralize detected object due to user-defined settings*. The event specifies all available information about the detected object.

   The **Notify only** mode should be separately configured for each protection or scan area. This mode is not used by default on any of the security levels. If you select this mode, Kaspersky Security for Windows Server automatically changes the security level to **Custom**.
• Disinfect.
• Disinfect. Remove if disinfection fails.
• Remove.
• Perform recommended action.

7. Select the action to be performed on probably infected objects:
   • Notify only.
     When this mode is selected, Kaspersky Security for Windows Server does not block access to detected or other detected objects, or perform any actions on them. The following event is registered in the task log: Object not disinfected. Reason: no action was taken to neutralize detected object due to user-defined settings. The event specifies all available information about the detected object.

     The Notify only mode should be separately configured for each protection or scan area. This mode is not used by default on any of the security levels. If you select this mode, Kaspersky Security for Windows Server automatically changes the security level to Custom.

   • Quarantine.
   • Remove.
   • Perform recommended action.

8. Configure actions to be performed on objects depending on the type of object detected:
   a. Clear or select the Perform actions depending on the type of object detected check box.

     If the check box is selected, you can independently set primary and secondary action for each detected object type by clicking the Settings button next to the check box. At that, Kaspersky Security for Windows Server will not allow to open or execute an infected object regardless of your choice.

     If the check box is cleared, Kaspersky Security for Windows Server performs actions that are selected in the Action to perform on infected and other objects and Action to perform on probably infected objects sections for named object types respectively.

     The check box is cleared by default.

   b. Click the Settings button.

   c. In the window that opens select primary and secondary action (if the first action fails) for each type of the detected object.

   d. Click OK.
9. Select the action to perform on incurable compound objects: select or clear the **Entirely remove compound file that cannot be modified by the application in case of embedded object detect** check box.

This check box enables or disables forced removal of the parent compound file when a malicious, probably infected or other detected child embedded object is detected.

If the check box is selected and the task is configured to remove infected and probably infected objects, Kaspersky Security for Windows Server forcibly removes the entire parent compound object when a malicious or other embedded object is detected. Enforced removal of a parent file along with all of its contents happens if the application cannot remove only the detected child object (for example, if the parent object is unmodifiable).

If this check box is cleared and the task is configured to remove infected and probably infected objects, Kaspersky Security for Windows Server does not perform the selected action, if the parent object is unmodifiable.

10. Click **OK**.

New task configuration will be saved.

### Configuring performance

*To configure the performance for the On-Demand Scan task:*

1. Open the **Properties: On-Demand Scan** (see Section "Opening the On-Demand Scan task properties" on page 461) window.
2. Select the **Scan scope** tab.
3. Click the **Configure** button.
   - The **On-demand scan settings** window opens.
4. Click the **Settings** button.
5. Select the **Performance** tab.
6. In the **Exclusions** section:
   - Clear or select the **Exclude files** check box.
     - Excluding files from scanning by file name or file name mask.
     - If this check box is selected, Kaspersky Security for Windows Server skips specified objects during scanning.
     - If this check box is cleared, Kaspersky Security for Windows Server scans all objects.
     - The check box is cleared by default.
   - Clear or select the **Do not detect** check box.
     - Objects are excluded from scanning by the name or name mask of the detectable object.
     - The list of names of detectable objects is available on the Virus Encyclopedia [website](https://encyclopedia.kaspersky.com/knowledge/classification/).
     - If this check box is selected, Kaspersky Security for Windows Server skips specified detectable objects during scanning.
If the check box is cleared, Kaspersky Security for Windows Server detects all objects specified in the application by default.

The check box is cleared by default.

- Click the **Edit** button for each setting to add exclusions.

7. In the **Advanced settings** section:

- **Stop scanning if it takes longer than (sec.)**
  
  Limits the duration of object scanning. The default value is 60 seconds.
  
  If the check box is cleared, scan duration is limited to the specified value.
  
  If the check box is cleared, scan duration is unlimited.
  
  By default, the check box is selected for the **Maximum performance** security level.

- **Do not scan compound objects larger than (MB)**
  
  Excludes objects larger than the specified size from the scanning.
  
  If the check box is selected, Kaspersky Security for Windows Server skips compound objects whose size exceeds the specified limit during virus scan.
  
  If this check box is cleared, Kaspersky Security for Windows Server scans compound objects of any size.
  
  By default, the check box is selected for the **Maximum performance** security level.

- **Use iSwift technology**
  
  iSwift compares file NTFS identifier, that is stored in a database, with a current identifier. The scanning is performed only for files, whose identifiers has changed (new files and files modified since the last scan of NTFS system objects).
  
  If the check box is selected, Kaspersky Security for Windows Server scans only new files or those modified since the last scan of NTFS system objects.
  
  If the check box is cleared, Kaspersky Security for Windows Server scans objects of NTFS file system disregarding the date of file creation or modification except for files from network folders.
  
  The check box is selected by default.

- **Use iChecker technology**
  
  iChecker calculates and remembers checksums of scanned files. If an object is modified the checksum changes. The application compares all checksums during the scan task and scans only new and modified since the last scan files.
  
  If the check box is selected, Kaspersky Security for Windows Server scans only new and modified files.
  
  If the check box is cleared, Kaspersky Security for Windows Server scans files disregarding the date of file creation or modification.
  
  The check box is selected by default.

8. Click **OK**.

New task configuration will be saved.
Configuring the Removable Drives Scan

To configure scanning of the removable drives upon connection to the protected server:

1. Expand the Managed devices node in the Kaspersky Security Center Administration Console tree.
2. Select the administration group for which you want to configure the task.
3. Select the Policies tab.
4. Double-click the policy name you want to configure.
   In the Properties: <Policy name> window that opens, select the Supplementary section.
5. Click the Settings button in the Removable Drives Scan subsection.
   The Removable Drives Scan window opens.
6. In the Scan on connection section do the following:
   • Select the Scan removable drives on connection via USB check box, if you want Kaspersky Security for Windows Server to automatically scan removable drives when they are connected.
   • If required, select the Scan removable drives if its stored data volume does not exceed (MB) and specify the maximum value in the field on the right.
   • In the Scan with security level drop-down list specify the security level with the settings that are required for removable drives scanning.
7. Click OK.
   The specified settings are saved and applied.

Managing On-Demand Scan tasks via the Application Console

In this section, learn how to navigate the Application Console interface and configure task settings on a local server.

In this section

| Opening the On-Demand Scan task settings ........................................................................................................ 476 |

Opening the On-Demand Scan task settings

► To open the general settings of the On-Demand Scan task via the Application Console:

1. Expand the On-Demand Scan node in the Application Console tree.
2. Select the child node that corresponds to the task that you want to configure.
3. In the child node details pane click the Properties link.
   The Task settings window opens.

► To open the scan scope settings window via the Application Console:

1. Expand the On-Demand Scan node in the Application Console tree.
2. Select the child node corresponding to an On-Demand Scan task that you want to configure.
3. In the details pane of the selected node click the Configure scan scope link.
   Scan scope settings window opens.

Creating and configuring an On-Demand Scan task

Custom tasks for a single server can be created in the On-Demand Scan node. In the other functional components of Kaspersky Security for Windows Server creation of custom tasks is not available.

► To create and configure a new On-Demand Scan task:

1. In the Application Console tree, open the context menu of the On-Demand Scan node.
2. Select Add task.
   The Add task window opens.
3. Configure the following task settings:
   • Name – task name of no more than 100 characters, may contain any symbols apart from " * < > & \ : |.
     You cannot save a task or configure a new task on the Schedule, Advanced and Run as tabs if the task name is not specified.
   • Description – any additional information about the task, no more than 2000 characters. This information will be displayed in the task properties window.
- **Use heuristic analyzer.**
  
  This check box enables / disables Heuristic Analyzer during object scanning.
  
  If the check box is selected, Heuristic Analyzer is enabled.
  
  If the check box is cleared, Heuristic Analyzer is disabled.
  
  The check box is selected by default.

- **Perform task in background mode.**
  
  The check box modifies the priority of the task.
  
  If the check box is selected, the task priority in the operating system is reduced.
  
  The operating system provides resources for performing the task depending on the load on the CPU and the server file system from other Kaspersky Security for Windows Server tasks and other applications. As a result, task performance will slow down during increased loads and will speed up at lower loads.
  
  If the check box is cleared, the task will start and run with the same priority as the other Kaspersky Security for Windows Server tasks and other applications. In this case, the speed of task execution increases.
  
  The check box is cleared by default.

- **Apply Trusted Zone.**
  
  This check box enables / disables use of the Trusted Zone for a task.
  
  If the check box is selected, Kaspersky Security for Windows Server adds file operations of trusted processes to the scan exclusions configured in the task settings.
  
  If the check box is cleared, Kaspersky Security for Windows Server disregards the file operations of trusted processes when forming the protection scope for the task.
  
  The check box is selected by default.

- **Consider task as critical areas scan.**
  
  The check box changes the task priority: enables or disables logging of the Critical Areas Scan event and refreshing of the server protection status. Kaspersky Security Center evaluates the security rating of the server (servers) by the performance results of tasks with the Critical Areas Scan status. The check box is not available in the properties of local system and custom tasks of Kaspersky Security for Windows Server. You can edit this setting only on the side of Kaspersky Security Center.
  
  If this check box is selected, Administration Server logs the Critical Areas Scan completion and refreshes the server protection status based on the task execution results. The scan task has a high priority.
  
  If the check box is cleared, the task is run with a low priority.
  
  The check box is cleared by default for custom On-demand tasks.

- **Use KSN for scanning.**
  
  This check box enables / disables the use of Kaspersky Security Network (KSN) cloud services in the task.
  
  If the check box is selected, the application uses data received from KSN services to ensure a faster response time by the application to new threats and reduce the likelihood of false positives.
If the check box is cleared, the On-Demand Scan task does not use KSN services.

The check box is selected by default.

4. Configure the task start schedule settings (see Section "Configuring the task start schedule settings" on page 153) on the Schedule and Advanced tabs.

5. On the Run as tab, configure the task start settings with account permissions (see Section "Specifying a user account to start a task" on page 155).

6. Click OK in the Add task window.

   A new custom On-Demand Scan task is created. A node with the name of the new task is displayed in the Application Console tree. The operation is registered in the system audit log (on page 206).

7. If required, in the details pane of the selected node, select Configure scan scope.

   The Scan scope settings window opens.

8. In the server file resources tree or list, select the nodes or items that you want to include in the scan scope.

9. Select one of the predefined security levels (see Section "About predefined security levels for On-Demand Scan tasks" on page 455) or configure the scan settings manually (see Section "Configuring security settings manually" on page 482).

10. Click Save in the Scan scope settings window.

    The configured settings are applied at the next task start.

Scan scope in On-Demand Scan tasks

This section contains information on creating and using a scan scope in On-Demand Scan tasks.

In this section

| Configuring view mode for network file resources | 479 |
| Creating scan scope | 479 |
| Including network objects in the scan scope | 481 |
| Creating a virtual scan scope | 481 |
Configuring view mode for network file resources

To select a view mode for the network file resources during configuring the scan scope settings:

1. Open the Scan scope settings (on page 476) window.
2. Open the drop down list in the upper left section of the window. Perform one of the following steps:
   - Select the Tree-view option to display the network file resources in a tree-view mode.
   - Select the List-view option to display the network file resources in a list-view mode.

By default, the network file resources of the protected server are displayed in a list-view mode.

3. Click the Save button.
   Scan scope settings window will close. The newly configured settings will be applied.

Creating scan scope

If you are remotely managing Kaspersky Security for Windows Server on the protected server using the Application Console installed on administrator's workstation, you must be a member of administrators group on the protected server to be able to view folders on it.

The names of settings may vary under different Windows operating systems.

If you modify the scan scope in the Scan at Operating System Startup and Critical Areas Scan tasks, you can restore the default scan scope in these tasks by restoring Kaspersky Security for Windows Server itself (Start > Programs > Kaspersky Security for Windows Server > Modify or Remove Kaspersky Security for Windows Server). In the setup wizard, select Repair installed components and click Next, and then select the Restore recommended application settings check box.

The procedure of creating an On-Demand Scan task scope depends on the network file resources view mode (see Section "Configuring view mode for network file resources" on page 479). You can configure network file resources view mode as a tree or as a list (set as default).

To create a scan scope working with a network file resources tree:

1. Open the Scan scope settings window (on page 476).
2. In the left section of the window open the network file resources tree to display all the nodes and child nodes.
3. Do the following:
   - To exclude individual nodes from the scan scope, clear the check boxes next to the names of these nodes.
   - To include individual nodes in the scan scope, clear the My Computer check box and do the following:
     - If all drives of one type are to be included in the scan scope, select the check box opposite the name of the required drive type (for example, to add all removable drives on the server, select the Removable drives check box).
• If an individual drive of a certain type is to be included in the scan scope, expand the node that contains the list of drives of this type and check the box next to the name of the required drive. For example, in order to select the removable drive F:, expand node Removable drives and select the check box for the drive F:

• If you would like to include only a single folder or file on the drive, select the check box next to the name of that folder or file.

4. Click the Save button.

Scan scope settings window will be closed. Your newly configured settings will be saved.

► To create a scan scope using the network file resources list:

1. Open the Scan scope settings window (on page 476).

2. To include individual nodes in the scan scope, clear the My Computer check box and do the following:
   a. Open the context menu on the scan scope by right-clicking it.
   b. In the context menu of the button, select Add scan scope.
   c. In the opened Add scan scope window select an object type that you want to add:
      • Predefined scope to add one of the predefined scopes on a protected server. Then in the drop-down list select a necessary scan scope.
      • Disk, folder or network location to include individual drive, folder or a network object into a scan scope. Then select a necessary scope by clicking the Browse button.
      • File to include an individual file into scan scope. Then select a necessary scope by clicking the Browse button.

You cannot add an object into a scan scope if it has already been added as an exclusion out of the scan scope.

3. To exclude individual nodes from the scan scope, clear the check boxes next to the names of these nodes or take the following steps:
   a. Open the context menu on the scan scope by right-clicking it.
   b. In the context menu select Add exclusion option.
   c. In the Add exclusion window select an object type that you want to add as an exclusion out of the scan scope following the logic of the adding object to a scan scope procedure.

4. To modify the scan scope or an exclusion added, select the Edit scope option in the context menu for the necessary scan scope.

5. To hide the previously added scan scope or an exclusion in the list of network file resources, select the Remove from the list option in the context menu for the necessary scan scope.

The scan scope is excluded out of the On-Demand Scan task scope on its removal from the network file resources list.

6. Click the Save button.

Scan scope settings window will be closed. Your newly configured settings will be saved.
Including network objects in the scan scope

Network drives, folders or files can be added to the scan scope by specifying their path in UNC (Universal Naming Convention) format.

You can scan network folders under the system account.

► To add a network place to the scan scope:

1. Open the Scan scope settings (on page 476) window.
2. Open the drop-down list in the window upper left sector and select Tree-view.
3. In the context menu of the Network node:
   - Select Add network folder, if you want to add a network folder to the scan scope.
   - Select Add network file, if you want to add a network file to the scan scope.
4. Enter the path to network folder or file in UNC format and press the ENTER key.
5. Select the check box next to the newly added network object to include it in the scan scope.
6. If necessary, change the security settings for the network object added.
7. Click the Save button.

The modified task settings are saved.

Creating a virtual scan scope

Dynamic drives, folders, and files can be included in the scan scope in order to create a virtual scan scope.

You can expand the protection / scan scope by adding individual virtual drives, folders, or files only if the protection / scan scope is presented as a tree of file resources (see Section “Configuring view mode for network file resources” on page 479).

► To add a virtual drive to the scan scope:

1. Open the Scan scope settings (on page 476) window.
2. Open the drop-down list in the window upper left sector and select Tree-view.
3. In the server file resource tree open the context menu on the Virtual drives node, click Add virtual drive and select the virtual drive name from the list of available names.
4. Select the check box next to the added drive in order to include the drive in the scan scope.
5. Click the Save button.

The modified task settings are saved.
To add a virtual folder or virtual file to the scan scope:

1. Open the Scan scope settings window (on page 476).
2. Open the drop-down list in the window upper left sector and select Tree-view.
3. In the server file resources tree open the context menu of the node to add a folder or file, and select one of the following options:
   - Add virtual folder if you want to add a virtual folder to the scan scope.
   - Add virtual file if you want to add a virtual file to the scan scope.
4. In the entry field specify the name of the folder or file.
5. In the line with the name of the folder or file created, select the check box to include this folder or file in the scan scope.
6. Click the Save button.

The modified task settings are saved.

Selecting predefined security levels for On-Demand Scan tasks

One of three predefined security levels for a node or an item selected in the tree or in the list of the server network file resources can be applied: Maximum performance, Recommended, and Maximum protection.

To select one of the predefined security levels:

1. Open the Scan scope settings (on page 476) window.
2. In the tree or in the list of the server network file resources select a node or item to set the predefined security level.
3. Make sure that the selected node or item is included in the scan scope.
4. In the right sector of the window, on the Security level tab select the security level to be applied.
   - The window displays the list of security settings corresponding to the security level selected.
5. Click the Save button.

Configured task settings are saved and applied immediately to the running task. If the task is not running, the modified settings are applied at next start.

Configuring security settings manually

By default On-Demand Scan tasks use common security settings for the entire scan scope. These settings correspond to the Recommended predefined security level (see Section “Predefined security levels” on page 240).

The default values of security settings can be modified by configuring them as common settings for the entire protection scope or as different settings for different items in the server file resource list or nodes in the tree.

When working with the network file resources tree, security settings that are configured for the selected parent node are automatically applied to all child nodes. The security settings of the parent node are not applied to child nodes that are configured separately.
To configure security settings manually:

1. Open the **Scan scope settings** (on page 476) window.
2. In the left window section select the node or item to configure security settings.
   A predefined template containing security settings (see Section "About security settings templates" on page 159) can be applied for a selected node or item in the scan scope.
3. Configure the required security settings of the selected node or item in accordance with your requirements in the following tabs:
   - General settings (see Section "Configuring general task settings" on page 483)
   - Actions (see Section "Configuring actions" on page 486)
   - Performance (see Section "Configuring performance" on page 487)
   - Hierarchical storage
4. Click **Save** in the **Scan scope settings** window.

New scan scope settings are saved.

In this section

<table>

</tbody>
</table>

**Configuring general task settings**

To configure the general security settings of the On-Demand Scan task:

1. Open the **Scan scope settings** (on page 476) window.
2. Select the **General** tab.
3. In the **Scan objects** section, specify the object types that you want to include in the scan scope:
   - **Objects to scan**
     - **All objects**
       Kaspersky Security for Windows Server scans all objects.
   - **Objects scanned by format**
     Kaspersky Security for Windows Server scans only infectable objects based on file format.
     Kaspersky Lab compiles the list of formats. It is included in the Kaspersky Security for Windows Server databases.
• **Objects scanned according to list of extensions specified in anti-virus database**
  Kaspersky Security for Windows Server scans only infectable objects based on file extension.
  Kaspersky Lab compiles the list of extensions. It is included in the Kaspersky Security for Windows Server databases.

• **Objects scanned by specified list of extensions**
  Kaspersky Security for Windows Server scans files based on file extension. List of file extensions can be manually customized in the **List of extensions** window, which can be opened by clicking the **Edit** button.

• **Scan disk boot sectors and MBR**
  Enables protection of boot sectors and master boot records.
  If the check box is selected, Kaspersky Security for Windows Server scans boot sectors and master boot records on hard drives and removable drives of the server.
  The check box is selected by default.

• **Scan alternate NTFS streams**
  Scanning of alternative file and folder streams on the NTFS file system drives.
  If the check box is selected, the application scans a probably infected object and all NTFS streams associated with that object.
  If the check box is cleared, the application scans only the object that was detected and considered as probably infected.
  The check box is selected by default.

4. In the **Performance** section, select or clear the **Scan only new and modified files** check box.
   This check box enables / disables scanning and protection of files that have been recognized by Kaspersky Security for Windows Server as new or modified since the last scan.
   If the check box is selected, Kaspersky Security for Windows Server scans and protects only the files that it has recognized as new or modified since the last scan.
   If the check box is cleared, you can select if you want to scan and protect only new files or all files disregarding their modification status.
   By default, the check box is selected for the **Maximum performance** security level. If the **Maximum protection** or **Recommended** security levels are set, the check box is cleared.

   **To switch between available options when the check box is cleared, click on the **All / Only new** link for each of the compound object types.**

5. In the **Scan of compound objects** section, specify the compound objects that you want to include in the scan scope:
   • **All / Only new archives**
     Scanning of ZIP, CAB, RAR, ARJ archives and other archive formats.
     If this check box is selected, Kaspersky Security for Windows Server scans archives.
If this check box is cleared, Kaspersky Security for Windows Server skips archives during scanning.

The default value depends on the selected protection level.

- **All / Only new SFX archives**
  Scanning of self-extracting archives.
  If this check box is selected, Kaspersky Security for Windows Server scans SFX archives.
  If this check box is cleared, Kaspersky Security for Windows Server skips SFX archives during scanning.
  The default value depends on the selected protection level.
  This option is active when the **Archives** check box is cleared.

- **All / Only new email databases**
  Scanning of Microsoft Outlook and Microsoft Outlook Express mail database files.
  If this check box is selected, Kaspersky Security for Windows Server scans mail database files.
  If this check box is cleared, Kaspersky Security for Windows Server skips mail database files during scanning.
  The default value depends on the selected security level.

- **All / Only new packed objects**
  Scanning of executable files packed by binary code packers, such as UPX or ASPack.
  If this check box is selected, Kaspersky Security for Windows Server scans executable files packed by packers.
  If this check box is cleared, Kaspersky Security for Windows Server skips executable files packed by packers during scanning.
  The default value depends on the selected protection level.

- **All / Only new plain email**
  Scanning of files of mail formats, such as Microsoft Outlook and Microsoft Outlook Express messages.
  If this check box is selected, Kaspersky Security for Windows Server scans files of mail formats.
  If this check box is cleared, Kaspersky Security for Windows Server skips files of mail formats during scanning.
  The default value depends on the selected security level.

- **All / Only new embedded OLE objects**
  Scanning of objects embedded into files (such as Microsoft Word macros, or email message attachments).
  If this check box is selected, Kaspersky Security for Windows Server scans objects embedded into files.
If this check box is cleared, Kaspersky Security for Windows Server skips objects embedded into files during scanning.

The default value depends on the selected protection level.

6. Click **Save**.

New task configuration will be saved.

**Configuring actions**

► To configure the actions on infected and other detected objects for the On-Demand Scan task:

1. Open the **Scan scope settings** (on page 476) window.
2. Select the **Actions** tab.

3. Select the action to be performed on infected and other detected objects:
   - **Notify only**.
     When this mode is selected, Kaspersky Security for Windows Server does not block access to detected or other detected objects, or perform any actions on them. The following event is registered in the task log: *Object not disinfected. Reason: no action was taken to neutralize detected object due to user-defined settings.* The event specifies all available information about the detected object.

     The **Notify only** mode should be separately configured for each protection or scan area. This mode is not used by default on any of the security levels. If you select this mode, Kaspersky Security for Windows Server automatically changes the security level to **Custom**.

   - **Disinfect**.
   - **Disinfect. Remove if disinfection fails**.
   - **Remove**.
   - **Perform recommended action**.

4. Select the action to be performed on probably infected objects:
   - **Notify only**.
     When this mode is selected, Kaspersky Security for Windows Server does not block access to detected or other detected objects, or perform any actions on them. The following event is registered in the task log: *Object not disinfected. Reason: no action was taken to neutralize detected object due to user-defined settings.* The event specifies all available information about the detected object.

     The **Notify only** mode should be separately configured for each protection or scan area. This mode is not used by default on any of the security levels. If you select this mode, Kaspersky Security for Windows Server automatically changes the security level to **Custom**.

   - **Quarantine**.
   - **Remove**.
   - **Perform recommended action**.
5. Configure actions to be performed on objects depending on the type of object detected:
   a. Clear or select the **Perform actions depending on the type of object detected** check box.
      
      If the check box is selected, you can independently set primary and secondary action for each detected object type by clicking the **Settings** button next to the check box. At that, Kaspersky Security for Windows Server will not allow to open or execute an infected object regardless of your choice.
      
      If the check box is cleared, Kaspersky Security for Windows Server performs actions that are selected in the **Action to perform on infected and other objects** and **Action to perform on probably infected objects** sections for named object types respectively.
      
      The check box is cleared by default.
   b. Click the **Settings** button.
   c. In the window that opens select primary and secondary action (if the first action fails) for each type of the detected object.
   d. Click **OK**.

6. Select the action to perform on incurable compound objects: select or clear the **Entirely remove compound file that cannot be modified by the application in case of embedded object detect** check box.

   This check box enables or disables forced removal of the parent compound file when a malicious, probably infected or other detected child embedded object is detected.

   If the check box is selected and the task is configured to remove infected and probably infected objects, Kaspersky Security for Windows Server forcibly removes the entire parent compound object when a malicious or other embedded object is detected. Enforced removal of a parent file along with all of its contents happens if the application cannot remove only the detected child object (for example, if the parent object is unmodifiable).

   If this check box is cleared and the task is configured to remove infected and probably infected objects, Kaspersky Security for Windows Server does not perform the selected action, if the parent object is unmodifiable.

7. Click **Save**.

   New task configuration will be saved.

**Configuring performance**

▶ *To configure the performance for the On-Demand Scan task:*

1. Open the **Scan scope settings** (on page 476) window.
2. Select the **Performance** tab.
3. In the **Exclusions** section:
   - Clear or select the **Exclude files** check box.
     
     Excluding files from scanning by file name or file name mask.

     If this check box is selected, Kaspersky Security for Windows Server skips specified objects during scanning.
If this check box is cleared, Kaspersky Security for Windows Server scans all objects. The check box is cleared by default.

- Clear or select the **Do not detect** check box.

  Objects are excluded from scanning by the name or name mask of the detectable object. The list of names of detectable objects is available on the Virus Encyclopedia [https://encyclopedia.kaspersky.com/knowledge/classification/](https://encyclopedia.kaspersky.com/knowledge/classification/) website.

  If this check box is selected, Kaspersky Security for Windows Server skips specified detectable objects during scanning.

  If the check box is cleared, Kaspersky Security for Windows Server detects all objects specified in the application by default.

  The check box is cleared by default.

- Click the **Edit** button for each setting to add exclusions.

4. In the **Advanced settings** section:

   - **Stop scanning if it takes longer than (sec.)**

     Limits the duration of object scanning. The default value is 60 seconds.

     If the check box is cleared, scan duration is limited to the specified value.

     If the check box is cleared, scan duration is unlimited.

     By default, the check box is selected for the **Maximum performance** security level.

   - **Do not scan compound objects larger than (MB)**

     Excludes objects larger than the specified size from the scanning.

     If the check box is selected, Kaspersky Security for Windows Server skips compound objects whose size exceeds the specified limit during virus scan.

     If this check box is cleared, Kaspersky Security for Windows Server scans compound objects of any size.

     By default, the check box is selected for the **Maximum performance** security level.

   - **Use iSwift technology**

     iSwift compares file NTFS identifier, that is stored in a database, with a current identifier. The scanning is performed only for files, whose identifiers has changed (new files and files modified since the last scan of NTFS system objects).

     If the check box is selected, Kaspersky Security for Windows Server scans only new files or those modified since the last scan of NTFS system objects.

     If the check box is cleared, Kaspersky Security for Windows Server scans objects of NTFS file system disregarding the date of file creation or modification except for files from network folders.

     The check box is selected by default.

   - **Use iChecker technology**

     iChecker calculates and remembers checksums of scanned files. If an object is modified the checksum changes. The application compares all checksums during the scan task and scans only new and modified since the last scan files.

     If the check box is selected, Kaspersky Security for Windows Server scans only new and modified files.
If the check box is cleared, Kaspersky Security for Windows Server scans files disregarding the date of file creation or modification.

The check box is selected by default.

5. Click **Save**.

New task configuration will be saved.

**Configuring hierarchical storage**

*To configure the actions on infected and other detected objects for the On-Demand Scan task:*

1. Open the **Scan scope settings** (on page 476) window.
2. Select the **Hierarchical storage** tab.
3. Select the action to be performed on the offline files:
   - **Do not scan.**
   - **Scan resident part of file only.**
   - **Scan entire file.**
     
     If this action is selected, you can specify the following options:
     
     - Select or clear the **Only if the file has been accessed within the specified period (days)** check box and specify the number of days.
     - Select or clear the **Do not copy file to a local hard drive, if possible** check box.
4. Click **Save**.

New task configuration will be saved.

**Scanning removable drives**

*To configure scanning of the removable drives upon connection to the protected server in the Application Console:*

1. In the Application Console tree, open the context menu of the **Kaspersky Security** node and select the **Configure removable drives scan settings** option.

   The **Removable Drives Scan** window opens.
2. In the **Scan on connection** section do the following:
   
   - Select the **Scan removable drives on connection via USB** check box, if you want Kaspersky Security for Windows Server to automatically scan removable drives when they are connected.
   - If required, select the **Scan removable drives if its stored data volume does not exceed (MB)** and specify the maximum value in the field on the right.
   - In the **Scan with security level** drop-down list specify the security level with the settings that are required for removable drives scanning.
3. Click **OK**.

The specified settings are saved and applied.
On-Demand Scan task statistics

While the On-Demand Scan task is being executed, you can view information about the number of objects processed by Kaspersky Security for Windows Server since it was started until the current moment.

This information remains available even if the task is paused. You can view the task statistics in the task log (see Section "Viewing statistics and information about a Kaspersky Security for Windows Server task in task logs" on page 210).

To view the statistics of an On-Demand Scan task, take the following steps:

1. Expand the On-Demand Scan node in the Application Console tree.
2. Select the On-Demand Scan task whose statistics you want to view.

Task statistics are displayed in the Statistics section of the details pane of the selected node.

The information about objects processed by Kaspersky Security for Windows Server since it was started until the current moment is presented in the table below.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Detected</td>
<td>Number of objects detected by Kaspersky Security for Windows Server. For example, if Kaspersky Security for Windows Server detects one malware in five files, the value in this field increases by one.</td>
</tr>
<tr>
<td>Infected and other objects detected</td>
<td>Number of objects that Kaspersky Security for Windows Server found and classified as infected or number of found legitimate software files, which were not excluded from the real-time protection and on-demand tasks scope and were classified as legitimate software that can be used by intruders to damage your computer or personal data.</td>
</tr>
<tr>
<td>Probably infected objects detected</td>
<td>Number of objects found by Kaspersky Security for Windows Server to be probably infected.</td>
</tr>
<tr>
<td>Objects not disinfected</td>

</table>

You can also view the On-Demand Scan task statistics in the selected task log by clicking the **Open task log** link in the **Management** section of the details pane.

It is recommended to manually process events registered in the task log on the **Events** tab upon the task completion.
Trusted Zone

This section provides information about the Trusted Zone of Kaspersky Security for Windows Server, as well as instructions on how to add objects to the Trusted Zone when executing the tasks.

In this chapter

About the Trusted Zone ................................................................. 492
Managing Trusted Zone via the Administration Plug-in ......................... 493
Managing Trusted Zone via the Application Console .......................... 499

About the Trusted Zone

The Trusted Zone is a list of exclusions from the protection or scan scope that you can generate and apply to On-Demand Scan and Real-Time File Protection tasks, Traffic Security, Script Monitoring, and RPC Network Storage Protection.

If you selected the Add Microsoft recommended files to exclusions list and Add Kaspersky Lab recommended files to exclusions list check boxes when installing Kaspersky Security for Windows Server, Kaspersky Security for Windows Server adds to the Trusted Zone files recommended by Microsoft and Kaspersky Lab for Real-Time Server Protection tasks.

You can create a Trusted Zone in Kaspersky Security for Windows Server according to the following rules:

- Trusted processes. Objects accessed by application processes that are sensitive to file intercepts are placed in the Trusted Zone.
- Backup operations. Objects accessed by systems to backup hard drives to external devices are placed in the Trusted Zone.
- Exclusions. Objects specified by their location and / or an object detected inside them are placed in the Trusted Zone.

You can apply the Trusted Zone in the Real-Time File Protection task, Traffic Security task, Script Monitoring task, RPC Network Storage Protection task, newly created custom On-Demand Scan tasks, and all system On-Demand Scan tasks, except for the Quarantine Scan task.

The Trusted Zone is applied in Real-Time File Protection and On-Demand Scan tasks by default.

The list of rules for generating the Trusted Zone can be exported to a configuration file in XML format for it then to be imported into Kaspersky Security for Windows Server running on another computer.

Trusted processes

Some applications on the server may be instable if the files that they access are intercepted by Kaspersky Security for Windows Server. Such applications include, for example, system domain controller applications.

To avoid disrupting the operation of such applications, you can disable protection of files accessed by the running processes of these applications (thereby creating a list of trusted processes within the Trusted Zone).
Microsoft Corporation recommends excluding some Microsoft Windows operating system files and Microsoft application files from Real-Time File Protection as programs that cannot be infected. The names of some of these are listed on the Microsoft website https://www.microsoft.com/en-us/ (article code: KB822158).

You can enable or disable the use of trusted processes in the Trusted Zone.

If the executable process file is modified, for example, if it is updated, Kaspersky Security for Windows Server will exclude it from the list of trusted processes.

The application does not apply path to file value on a protected server to trust the process. The path to the file on the protected server is used only to search for the file, calculate a checksum, and provide the user with the information about the source of the executable file.

**Backup operations**

Applies to Real-Time Server Protection tasks.

While data stored on hard drives is backed up to external devices, you can disable protection of objects that are accessed during the backup operations. Kaspersky Security for Windows Server will scan objects which the backup copying application opens for reading with the FILE_FLAG_BACKUP_SEMANTICS attribute.

**Exclusions**

You can select tasks for which you want to use every exclusion added to the Trusted Zone. Also, you can exclude objects from scans in the security level settings of every single Kaspersky Security for Windows Server task.

You can add objects to the Trusted Zone by their location on the server, by name or name mask of the object detected in those objects, or by using both criteria.

Based on the exclusion, Kaspersky Security for Windows Server can skip objects while performing the specified tasks according to the following settings:

- Specified objects detectable by name or name mask in the specified areas of the server or the network attached storages.
- All detectable objects in the specified areas of the server or the network attached storage.
- Specified detectable objects by name or name mask within the entire protection or scan scope.

**Managing Trusted Zone via the Administration Plug-in**

In this section, learn how to navigate through the Administration Plug-in interface and configure the Trusted Zone for one or for all servers of the network.
Navigation
Learn how to navigate to the required task settings via the interface.

In this section
Managing the application via the Kaspersky Security Center ................................................. 494
Opening the Trusted Zone properties window ................................................................. 494

Managing the application via the Kaspersky Security Center
► To open the Trusted Zone via the Kaspersky Security Center policy:
1. Expand the Managed devices node in the Kaspersky Security Center Administration Console tree.
2. Select the administration group for which you want to configure the task.
3. Select the Policies tab.
4. Double-click the policy name you want to configure.
5. In the Properties: <Policy name> window that opens, select the Supplementary section.
6. Click the Settings button in the Trusted Zone subsection.
   The Trusted Zone window opens.
Configure the policy as required.

If a server is being managed by an active Kaspersky Security Center policy and this policy blocks changes to
the application settings, these settings cannot be edited via the Application Console.

Opening the Trusted Zone properties window
► To configure the Trusted Zone in the Application properties window:
1. Expand the Managed devices node in the Kaspersky Security Center Administration Console tree.
2. Select the administration group for which you want to configure the task.
3. Select the Devices tab.
4. Open the Properties: <Server name> window in one of the following ways:
   • Double-click the name of the protected server.
   • Select the Properties item in the context menu of the protected server.
   The Properties: <Server name> window opens.
5. In the Applications section, select the Kaspersky Security for Windows Server.
6. Click the **Properties** button.
   The **Kaspersky Security for Windows Server settings** window opens.

7. Select the **Supplementary** section.

8. Click the **Settings** button in the **Trusted Zone** subsection.
   The **Trusted Zone** window opens.
   Configure the Trusted Zone as required.

### Configuring Trusted Zone settings via the Administration Plug-in

By default, Trusted Zone is applied for all newly created policies and tasks.

To configure Trusted Zone settings, do the following:

1. Specify the objects to be skipped (see Section "Adding an exclusion" on page 495) by Kaspersky Security for Windows Server during task execution on the **Exclusions** tab.

2. Specify the processes to be skipped (see Section "Adding trusted processes" on page 497) by Kaspersky Security for Windows Server during task execution on the **Trusted processes** tab.

3. Apply the not-a-virus mask (see Section "Applying the not-a-virus mask" on page 499).

### Adding an exclusion

► To **add an exclusion to the Trusted Zone via the Kaspersky Security Center policy**:

1. Open the **Trusted Zone** (see Section "Managing the application via the Kaspersky Security Center" on page 494) window.

2. On the **Exclusions** tab, specify the objects to be skipped by Kaspersky Security for Windows Server during scanning:
   - To create recommended exclusions, click the **Add recommended exclusions** button.
     Clicking this button allows you to extend the list of exclusions by adding exclusions recommended by Microsoft, exclusions recommended by Kaspersky Lab.
   - To import exclusions, click the **Import** button and in the window that opens select the files that Kaspersky Security for Windows Server will consider trusted.
   - To manually specify the conditions under which a file will be considered trusted click the **Add** button.
     The **Exclusion** window opens.
3. In the **Object will not be scanned if the following conditions are met** section, specify the objects that you want to exclude from the protection / scan scope and objects that you want to exclude among detectable objects:

- If you want to exclude an object from the protection or scan scope:
  a. Select the **Object to scan** check box.
     - Adds a file, folder, drive, or script file to an exclusion.
     - If the check box is selected, Kaspersky Security for Windows Server skips the specified predefined scope, file, folder, drive or script file while running the scan with the use of the Kaspersky Security for Windows Server component selected in the **Rule usage scope** section.
     - The check box is cleared by default.
  b. Click the **Edit** button.
     - The **Select an object** window opens.
  c. Specify the object that you want to exclude from the scan scope.
     - You can use the special symbols ? and * when specifying the objects.
  d. Click **OK**.
  e. Select the **Apply also to subfolders** check box, if you want to exclude all child files and folders of the specified object from the protection or scan scope.

- If you want to specify the name of a detectable object:
  a. Select the **Objects to detect** check box.
     - Objects are excluded from scanning by the name or name mask of the detectable object.
     - The list of names of detectable objects is available on the Virus Encyclopedia website.
     - If this check box is selected, Kaspersky Security for Windows Server skips specified detectable objects during scanning.
     - If the check box is cleared, Kaspersky Security for Windows Server detects all objects specified in the application by default.
     - The check box is cleared by default.
  b. Click the **Edit** button.
     - The **List of objects to detect** window opens.
  c. Specify the name or the mask of the name of the detectable object according to the Virus Encyclopedia classification.
  d. Click the **Add** button.
  e. Click **OK**.

4. In the **Rule usage scope** section, select the check boxes next to the names of the tasks to which the exclusion should be applied.

   Name of the Kaspersky Security for Windows Server task in which the rule is used.

5. Click **OK**.

The exclusion is displayed in the list on the **Exclusions** tab of the **Trusted Zone** window.
Adding trusted processes

To add one or a number of processes to the list of trusted processes:

1. Open the Trusted Zone window (see Section "Managing the application via the Kaspersky Security Center" on page 494).
2. Select the Trusted processes tab.
3. Select the Do not check file backup operations check box to skip scanning of file read operations.
   The check box enables or disables the scanning of file read operations if such operations are performed by backup tools installed on the server.
   If the check box is selected, Kaspersky Security for Windows Server skips file read operations performed by backup tools installed on the server.
   If the check box is cleared, Kaspersky Security for Windows Server scans file read operations performed by backup tools installed on the server.
   The check box is selected by default.
4. Select the Do not check file activity of the specified processes check box to skip file operations scanning for trusted processes.
   The check box enables or disables the scanning of file activity of trusted processes.
   If the check box is selected, Kaspersky Security for Windows Server skips operations of trusted processes during scanning.
   If the check box is cleared, Kaspersky Security for Windows Server scans file operations of trusted processes.
   The check box is cleared by default.
5. Click the Add button.
6. From the button context menu select one of the options:
   - Multiple processes.
     In the Trusted processes adding window that opens, configure the following:
     a. Use full process path on disk to consider it trusted.
        If the check box is selected, Kaspersky Security for Windows Server uses the full path to the file to determine whether the process is trusted.
        If the check box is cleared, the path to the file is not used to determine whether the process is trusted.
        The check box is cleared by default.
     b. Use process file hash to consider it trusted.
        If the check box is selected, Kaspersky Security for Windows Server uses the selected file hash to determine the process trust status.
        If the check box is cleared, the file hash is not used to determine the process trust status.
        The check box is selected by default.
     c. Click the Browse button to add data based on executable processes.
     d. Select an executable file in the window that opens.
You can only add one executable file at a time. Repeat steps c-d to add other executable files.

e. Click the **Processes** button to add data based on running processes.

f. Select processes in the window that opens. To select multiple processes, press and hold **CTRL** button while selecting.

g. Click **OK**.

It is required that the account under which the Real-Time File Protection task is run has the administrator rights on the server with Kaspersky Security for Windows Server installed in order to allow viewing the list of active processes. You can sort processes in the list of active processes by file name, process identifier (PID), or path to the executable file of the process on the local server. Note, that you can select running processes by clicking the **Processes** button only using the Application Console on a local server or in the specified host settings via the Kaspersky Security Center.

### One process based on file name and path.

In the **Adding a process** window that opens, do the following:

- a. Enter a path to executable file (including the file name).
- b. Click **OK**.

### One process based on object properties.

In the **Trusted process adding** window that opens, configure the following:

- a. Click the **Browse** button and select a process.
- b. **Use full process path on disk to consider it trusted**.
  
  If the check box is selected, Kaspersky Security for Windows Server uses the full path to the file to determine whether the process is trusted.
  
  If the check box is cleared, the path to the file is not used to determine whether the process is trusted.
  
  The check box is cleared by default.
- c. **Use process file hash to consider it trusted**.
  
  If the check box is selected, Kaspersky Security for Windows Server uses the selected file hash to determine the process trust status.
  
  If the check box is cleared, the file hash is not used to determine the process trust status.
  
  The check box is selected by default.
- d. Click **OK**.

To add the selected process to the list of trusted processes, at least one trust criterion must be selected.

7. In the **Adding trusted processes** window, click the **OK** button.

The selected file or process will be added to the list of trusted processes in the **Trusted Zone** window.
Applying the not-a-virus mask

The not-a-virus mask allows to skip legitimate software files and web resources, which can be considered harmful, during the scanning. The mask affects the following tasks:

- Real-Time File Protection.
- On-Demand scan.
- Script Monitoring.
- RPC Network Storage Protection.

If the mask is not added to exclusions list, Kaspersky Security for Windows Server will apply the actions specified in the task settings for the software or web resources which fall under this category.

To apply the not-a-virus mask:

1. Open the Trusted Zone window (see Section "Managing the application via the Kaspersky Security Center" on page 494).
2. On the Exclusions tab, in the Objects to detect column, scroll the list and select the line with not-a-virus:* value, if the check box is cleared.
3. Click OK.

New configuration is applied.

Managing Trusted Zone via the Application Console

In this section, learn how to navigate through the Application Console interface and configure the Trusted Zone on a local server.

In this section

| Applying Trusted Zone for tasks in the Application Console | 499 |
| Configuring Trusted Zone settings in the Application Console | 500 |

Applying Trusted Zone for tasks in the Application Console

By default, the Trusted Zone is applied in the Real-Time File Protection task, newly created custom On-Demand Scan tasks, and all system On-Demand Scan tasks, except the Quarantine Scan task.

After the Trusted Zone is enabled or disabled, the specified exclusions are immediately applied or cease to be applied in running tasks.
To enable or disable the use of the Trusted Zone in Kaspersky Security for Windows Server tasks:

1. In the Application Console tree, open the context menu of the task, for which you want to configure the Trusted Zone usage.
2. Select Properties.
   The Task settings window opens.
3. In the window that opens, select the General tab and do one of the following actions:
   - To apply the Trusted Zone in the task, select the Apply Trusted Zone check box.
   - To disable the Trusted Zone in the task, clear the Apply Trusted Zone check box.
4. If you want to configure Trusted Zone settings, click the link in the name of the Apply Trusted Zone check box.
   The Trusted Zone window opens.
5. Click OK in the Task settings window to save changes.

Configuring Trusted Zone settings in the Application Console

To configure Trusted Zone settings, do the following:

1. Specify the objects to be skipped (see Section "Adding an exclusion to the Trusted Zone" on page 500) by Kaspersky Security for Windows Server during task execution on the Exclusions tab.
2. Specify the processes to be skipped (see Section "Trusted processes" on page 502) by Kaspersky Security for Windows Server during task execution on the Trusted processes tab.
3. Apply the Trusted Zone for the application tasks (see Section "Applying Trusted Zone for tasks in the Application Console" on page 499).
4. Apply the not-a-virus mask (see Section "Applying the not-a-virus mask" on page 504).

In this section

<table>

</tbody>
</table>

Adding an exclusion to the Trusted Zone

To manually add an exclusion to the Trusted Zone via the Application Console:

1. In the Application Console tree, open the context menu of the Kaspersky Security node.
2. Select Configure Trusted Zone settings menu option.
   The Trusted Zone window opens.
3. Select the Exclusions tab.
4. Click the **Add** button.
   The **Exclusion** window opens.

5. In the **Object will not be scanned if the following conditions are met** section, specify the objects that you want to exclude from the protection / scan scope and objects that you want to exclude among detectable objects:
   - If you want to exclude an object from the protection or scan scope:
     a. Select the **Object to scan** check box.
        Adds a file, folder, drive, or script file to an exclusion.
        If the check box is selected, Kaspersky Security for Windows Server skips the specified predefined scope, file, folder, drive or script file while running the scan with the use of the Kaspersky Security for Windows Server component selected in the **Rule usage scope** section.
        The check box is cleared by default.
     b. Click the **Edit** button.
        The **Select an object** window opens.
     c. Specify the object that you want to exclude from the scan scope.
        You can use the special symbols ? and * when specifying the objects.
     d. Click **OK**.
     e. Select the **Apply also to subfolders** check box, if you want to exclude all child files and folders of the specified object from the protection or scan scope.
   - If you want to specify the name of a detectable object:
     a. Select the **Objects to detect** check box.
        Objects are excluded from scanning by the name or name mask of the detectable object.
        The list of names of detectable objects is available on the Virus Encyclopedia website.
        If this check box is selected, Kaspersky Security for Windows Server skips specified detectable objects during scanning.
        If the check box is cleared, Kaspersky Security for Windows Server detects all objects specified in the application by default.
        The check box is cleared by default.
     b. Click the **Edit** button.
        The **List of objects to detect** window opens.
     c. Specify the name or the mask of the name of the detectable object according to the Virus Encyclopedia classification.
     d. Click the **Add** button.
     e. Click **OK**.
6. In the **Rule usage scope** section, select the check boxes next to the names of the tasks to which the exclusion should be applied.

   Name of the Kaspersky Security for Windows Server task in which the rule is used.

7. Click **OK**.

   The exclusion is displayed in the list on the **Exclusions** tab of the **Trusted Zone** window.

---

**Trusted processes**

You can add a process to the list of trusted processes using one of the following methods:

- Select the process from the list of processes running on the protected server.
- Select the executable file of a process regardless of whether the process is currently running.

If the executable file of a process has been modified, Kaspersky Security for Windows Server excludes this process from the list of trusted processes.

---

▶ **To add one or a number of processes to the list of trusted processes:**

1. In the Application Console tree, open the context menu of the **Kaspersky Security** node.

2. Select **Configure Trusted Zone settings** menu option.

   The **Trusted Zone** window opens.

3. Select the **Trusted processes** tab.

4. Select the **Do not check file backup operations** check box to skip scanning of file read operations.

   The check box enables or disables the scanning of file read operations if such operations are performed by backup tools installed on the server.

   If the check box is selected, Kaspersky Security for Windows Server skips file read operations performed by backup tools installed on the server.

   If the check box is cleared, Kaspersky Security for Windows Server scans file read operations performed by backup tools installed on the server.

   The check box is selected by default.

5. Select the **Do not check file activity of the specified processes** check box to skip file operations scanning for trusted processes.

   The check box enables or disables the scanning of file activity of trusted processes.

   If the check box is selected, Kaspersky Security for Windows Server skips operations of trusted processes during scanning.

   If the check box is cleared, Kaspersky Security for Windows Server scans file operations of trusted processes.

   The check box is cleared by default.

6. Click the **Add** button.
7. From the button context menu select one of the options:

- **Multiple processes.**
  
  In the **Trusted processes adding** window that opens, configure the following:
  
  a. **Use full process path on disk to consider it trusted.**
  
     If the check box is selected, Kaspersky Security for Windows Server uses the full path to the file to determine whether the process is trusted.
  
     If the check box is cleared, the path to the file is not used to determine whether the process is trusted.
  
     The check box is cleared by default.
  
  b. **Use process file hash to consider it trusted.**
  
     If the check box is selected, Kaspersky Security for Windows Server uses the selected file hash to determine the process trust status.
  
     If the check box is cleared, the file hash is not used to determine the process trust status.
  
     The check box is selected by default.
  
  c. Click the **Browse** button to add data based on executable processes.
  
  d. Select an executable file in the window that opens.
  
     You can only add one executable file at a time. Repeat steps c-d to add other executable files.
  
  e. Click the **Processes** button to add data based on running processes.
  
  f. Select processes in the window that opens. To select multiple processes, press and hold **CTRL** button while selecting.
  
  g. Click **OK**.

---

- **One process based on file name and path.**

  In the **Adding a process** window that opens, do the following:
  
  a. Enter a path to executable file (including the file name).
  
  b. Click **OK**.

- **One process based on object properties.**

  In the **Trusted process adding** window that opens, configure the following:
  
  a. Click the **Browse** button and select a process.

---

It is required that the account under which the Real-Time File Protection task is run has the administrator rights on the server with Kaspersky Security for Windows Server installed in order to allow viewing the list of active processes. You can sort processes in the list of active processes by file name, process identifier (PID), or path to the executable file of the process on the local server. Note, that you can select running processes by clicking the **Processes** button only using the Application Console on a local server or in the specified host settings via the Kaspersky Security Center.
b. **Use full process path on disk to consider it trusted.**
   
   If the check box is selected, Kaspersky Security for Windows Server uses the full path to the file to determine whether the process is trusted.
   
   If the check box is cleared, the path to the file is not used to determine whether the process is trusted.
   
   The check box is cleared by default.

c. **Use process file hash to consider it trusted.**
   
   If the check box is selected, Kaspersky Security for Windows Server uses the selected file hash to determine the process trust status.
   
   If the check box is cleared, the file hash is not used to determine the process trust status.
   
   The check box is selected by default.

d. Click **OK**.

To add the selected process to the list of trusted processes, at least one trust criterion must be selected.

8. In the **Adding trusted processes** window, click the **OK** button.

   The selected file or process will be added to the list of trusted processes in the **Trusted Zone** window.

**Applying the not-a-virus mask**

The not-a-virus mask allows to skip legitimate software files and web resources, which can be considered harmful, during the scanning. The mask affects the following tasks:

- Real-Time File Protection.
- On-Demand scan.
- Script Monitoring.
- RPC-Network Storage Protection.

If the mask is not added to exclusions list, Kaspersky Security for Windows Server will apply the actions specified in the task settings for the software or web resources which fall under this category.

➤ **To apply the not-a-virus mask:**

1. In the Application Console tree, open the context menu of the **Kaspersky Security** node.
2. Select **Configure Trusted Zone settings** menu option.
   
   The **Trusted Zone** window opens.
3. Select the **Exclusions** tab.
4. Scroll the list and select the line with not-a-virus:* value, if the check box is cleared.
5. Click **OK**.

   New configuration is applied.
Exploit Prevention

This section contains instructions on how to configure process memory protection settings.

In this chapter

About the Exploit Prevention ................................................................. 505
Managing Exploit Prevention via the Administration Plug-in .................. 507
Managing Exploit Prevention via the Application Console ...................... 510
Exploit prevention techniques ............................................................... 514

About the Exploit Prevention

Kaspersky Security for Windows Server provides the ability to protect process memory from exploits. This feature is implemented in the Exploit Prevention component. You can change the component's activity status and configure process memory protection settings.

The component protects process memory from exploits by inserting an external Process Protection Agent ("Agent") in the protected process.

A Process Protection Agent is a dynamically loaded Kaspersky Security for Windows Server module that is inserted in protected processes to monitor their integrity and reduce the risk of being exploited.

The Agent's operation within the protected process requires starting and stopping the process: the initial loading of the Agent into a process added to the protected process list is only possible if the process is restarted. Additionally, after a process has been removed from the protected process list, the Agent can be unloaded only after the process has been restarted.

The Agent must be stopped to unload it from protected processes: if the Exploit Prevention component is uninstalled, the application freezes the environment and forces the Agent to be unloaded from protected processes. If during the component uninstallation the Agent is inserted in any of the protected processes, you must terminate the affected process. Server restart may be required (for example, if system process is being protected).

If evidence of an exploit attack in a protected process is detected, Kaspersky Security for Windows Server performs one of the following actions:

- Terminates the process if an exploit attempt is made.
- Reports the fact that the process has been compromised.

You can stop process protection using one of the following methods:

- Uninstalling the component.
- Removing the process from the list of protected processes and restarting the process.
Kaspersky Security Exploit Prevention Service

Kaspersky Security Exploit Prevention Service is required on the protected server in order for the Exploit Prevention component to be most effective. This service and the Exploit Prevention component are part of the recommended installation. During installation of the service on the protected server, the kavfswh process is created and started. This communicates information about protected processes from the component to the Security Agent.

After the Kaspersky Security Exploit Prevention Service is stopped, Kaspersky Security for Windows Server continues to protect processes added to the protected process list, is also loaded in newly-added processes, and applies all available exploit prevention techniques to protect process memory.

If the Kaspersky Security Exploit Prevention Service is stopped, the application will not receive information about events occurring with protected processes (including information about exploit attacks and the termination of processes). Furthermore, the Agent will not be able to receive information about new protection settings and the addition of new processes to the protected process list.

Exploit Prevention mode

You can select one of the following modes to configure actions to reduce risks that vulnerabilities will be exploited in protected processes:

- **Terminate on exploit**: apply this mode to terminate a process when an exploit attempt is made.

  Upon detecting an attempt to exploit a vulnerability in a protected critical operating system process, Kaspersky Security for Windows Server does not terminate the process, regardless of the mode indicated in the Exploit Prevention component settings.

- **Notify only**: apply this mode to receive information about instances of exploits in protected processes using events in the Security log.

  If this mode is selected, Kaspersky Security for Windows Server logs all attempts to exploit vulnerabilities by creating events.
Managing Exploit Prevention via the Administration Plug-in

In this section, learn how to navigate the Administration Plug-In interface and configure the component settings for one or all servers on the network.

Opening policy settings for the Exploit Prevention

► To open the Exploit Prevention settings via the Kaspersky Security Center policy:

1. Expand the Managed devices node in the Kaspersky Security Center Administration Console tree.
2. Select the administration group for which you want to configure the task.
3. Select the Policies tab.
4. Double-click the policy name you want to configure.
5. In the Properties: <Policy name> window that opens, select the Real-time server protection section.
6. Click the Settings button in the Exploit Prevention subsection.

The Exploit Prevention window opens.

Configure the Exploit Prevention as required.

Opening the Exploit Prevention properties window

► To open the Properties: <Server name> window for the Exploit Prevention:

1. Expand the Managed devices node in the Kaspersky Security Center Administration Console tree.
2. Select the administration group for which you want to configure the task.
3. Select the Devices tab.
4. Open the **Properties**: `<Server name>` window in one of the following ways:
   - Double-click the name of the protected server.
   - Select the **Properties** item in the context menu of the protected server.
   
   The **Properties**: `<Server name>` window opens.

5. In the **Applications** section, select the **Kaspersky Security for Windows Server**.

6. Click the **Properties** button.

   The **Kaspersky Security for Windows Server settings** window opens.

7. Select the **Real-time server protection** section.

8. Click the **Settings** button in the **Exploit Prevention** subsection.

   The **Exploit Prevention** window opens.

   Configure the Exploit Prevention as required.

---

### Configuring process memory protection settings

► To configure settings to protect the memory of processes added to the list of protected processes, perform the following actions:

1. Open the **Exploit Prevention** (see Section “Opening policy settings for the Exploit Prevention” on page 507) window.

2. In the **Exploit prevention mode** block, configure the following settings:
   - **Prevent vulnerable processes exploit.**
     
     If this check box is selected, Kaspersky Security for Windows Server reduces the risks of exploitation of vulnerabilities in processes in the list of protected processes.

     If this check box is cleared, Kaspersky Security for Windows Server does not protect server processes from exploits.

     The check box is cleared by default.
   
   - **Terminate on exploit.**
     
     If this mode is selected, Kaspersky Security for Windows Server terminates a protected process upon detecting an exploit attempt if an active impact reduction technique has been applied to the process.

   - **Notify only.**
     
     If this mode is selected, Kaspersky Security for Windows Server reports exploits by displaying a terminal window. The compromised process continues to run.

     If Kaspersky Security for Windows Server detects an exploit in a critical process while the application is running in **Terminate on exploit** mode, the component forcibly switches to **Notify only** mode.
3. In the **Preventing actions** block, configure the following settings:

- **Notify about abused processes via Terminal Service.**

  If this check box is selected, Kaspersky Security for Windows Server displays a terminal window with a description explaining why protection was activated and an indication of the process in which an exploit attempt was detected.

  If the check box is cleared, Kaspersky Security for Windows Server displays a terminal window when an exploit attempt or termination of a compromised process is detected. A terminal window is displayed regardless of the status of the Kaspersky Security Exploit Prevention Service. The check box is selected by default.

- **Prevent vulnerable processes exploit even if Kaspersky Security Service is disabled.**

  If this check box is selected, Kaspersky Security for Windows Server will reduce risk of vulnerabilities being exploited in processes that have already been started, regardless of whether the Kaspersky Security Service is running. Kaspersky Security for Windows Server will not protect processes added after the Kaspersky Security Service is stopped. After the service is started, exploit impact reduction will be stopped for all processes.

  If this check box is cleared, Kaspersky Security for Windows Server does not protect processes from exploits when the Kaspersky Security Service is stopped.

  The check box is selected by default.

4. Click OK.

Kaspersky Security for Windows Server saves and applies the configured process memory protection settings.

---

**Adding a process for protection**

Exploit Prevention component protects a number of processes by default. You can exclude the processes from the protection scope by clearing the corresponding check boxes in the list.

▶ **To add a process to the list of protected processes:**

1. Open the **Exploit Prevention** (see Section "Opening policy settings for the Exploit Prevention" on page 507) window.

2. On the **Protected processes** tab, click the **Browse** button.

   The Microsoft Windows Explorer window opens.

3. Select the process you want to add to the list.

4. Click the **Open** button.

   The process name is displayed in the line.

5. Click the **Add** button.

   The process will be added to the list of protected processes.

6. Select the added process.

7. Click **Set exploit prevention techniques**.

   The **Exploit prevention techniques** window opens.
8. Select one of the options for applying impact reduction techniques:

- **Apply all available exploit prevention techniques.**
  If this option is selected, the list cannot be edited. All techniques available for a process are applied by default.

- **Apply selected exploit prevention techniques.**
  If this option is selected, you can edit the list of impact reduction techniques applied:
  a. Select the check boxes next to the techniques that you want to apply to protect the selected process.
  b. Select or clear the **Apply Attack Surface Reduction technique** check box.

9. Configure settings for the Attack Surface Reduction technique:

- Enter the names of the modules whose launch will be blocked from the protected process in the **Deny modules** field.

- In the **Do not deny modules if launched in the Internet Zone** field, select the check boxes next to the options under which you want to allow modules to be launched:
  - Internet
  - Local intranet
  - Trusted sites
  - Restricted sites
  - Computer

  These settings are only applicable to Internet Explorer®.

10. Click **OK**.
    The process is added to the task protection scope.

### Managing Exploit Prevention via the Application Console

In this section, learn how to navigate the Application Console interface and configure the component settings on a local server.

In this section

Opening the Exploit Prevention general settings ................................................................. 511
Opening the Exploit Prevention process protection settings .................................................. 511

Opening the Exploit Prevention general settings

► To open the Exploit Prevention settings window:
   1. In the Application Console tree, select the Kaspersky Security node.
   2. Open the context menu and select the Exploit Prevention: general settings menu option.
      The Exploit Prevention settings window opens.
      Configure general settings for the Exploit Prevention as required.

Opening the Exploit Prevention process protection settings

► To open the Processes protection settings window:
   1. In the Application Console tree, select the Kaspersky Security node.
   2. Open the context menu and select the Exploit Prevention: processes protection settings menu option.
      The Processes protection settings window opens.
      Configure process protection settings for the Exploit Prevention as required.

Configuring process memory protection settings

► To add a process to the list of protected processes:
   1. Open the Exploit Prevention settings window.
   2. In the Exploit prevention mode block, configure the following settings:
      - Prevent vulnerable processes exploit.
        If this check box is selected, Kaspersky Security for Windows Server reduces the risks of exploitation of vulnerabilities in processes in the list of protected processes.
        If this check box is cleared, Kaspersky Security for Windows Server does not protect server processes from exploits.
        The check box is cleared by default.
- **Terminate on exploit.**
  If this mode is selected, Kaspersky Security for Windows Server terminates a protected process upon detecting an exploit attempt if an active impact reduction technique has been applied to the process.

- **Notify only.**
  If this mode is selected, Kaspersky Security for Windows Server reports exploits by displaying a terminal window. The compromised process continues to run.
  If Kaspersky Security for Windows Server detects an exploit in a critical process while the application is running in **Terminate on exploit** mode, the component forcibly switches to **Notify only** mode.

3. In the **Preventing actions** block, configure the following settings:
   - **Notify about abused processes via Terminal Service.**
     If this check box is selected, Kaspersky Security for Windows Server displays a terminal window with a description explaining why protection was activated and an indication of the process in which an exploit attempt was detected.
     If the check box is cleared, Kaspersky Security for Windows Server displays a terminal window when an exploit attempt or termination of a compromised process is detected. A terminal window is displayed regardless of the status of the Kaspersky Security Exploit Prevention Service. The check box is selected by default.
   - **Prevent vulnerable processes exploit even if Kaspersky Security Service is disabled.**
     If this check box is selected, Kaspersky Security for Windows Server will reduce risk of vulnerabilities being exploited in processes that have already been started, regardless of whether the Kaspersky Security Service is running. Kaspersky Security for Windows Server will not protect processes added after the Kaspersky Security Service is stopped. After the service is started, exploit impact reduction will be stopped for all processes.
     If this check box is cleared, Kaspersky Security for Windows Server does not protect processes from exploits when the Kaspersky Security Service is stopped. The check box is selected by default.

4. In the **Exploit Prevention settings** window click **OK**.
   Kaspersky Security for Windows Server saves and applies the configured process memory protection settings.

### Adding a process for protection

Exploit Prevention component protects a number of processes by default. You can uncheck the processes, that you don't want to protect in the list of protected processes.

▶ To add a process to the list of protected processes:

1. Open the Processes protection settings window.
2. To add a process to protect them from abuse and to reduce possible exploit impact, perform the following actions:
   a. Click the **Browse** button.
   The standard Microsoft Windows **Open** window opens.
b. In the window that opens select a process you want to add to the list.

c. Click the Open button.

d. Click the Add button.

The process will be added to the list of protected processes.

3. Select a process in the list.

4. On the Process protection settings, current configuration is displayed:

- Process name.
- Is being executed.
- Exploit prevention techniques applied.
- Attack Surface Reduction settings.

5. To modify the exploit prevention techniques that are applied to the process, select the Exploit prevention techniques tab.

6. Select one of the options for applying impact reduction techniques:

- **Apply all available exploit prevention techniques.**
  
  If this option is selected, the list cannot be edited. All techniques available for a process are applied by default.

- **Apply listed exploit prevention techniques for the process.**
  
  If this option is selected, you can edit the list of impact reduction techniques applied:
  a. Select the check boxes next to the techniques that you want to apply to protect the selected process.

7. Configure settings for the Attack Surface Reduction technique:

- Enter the names of the modules whose launch will be blocked from the protected process in the Deny modules field.

- In the Do not deny modules if launched in the Internet Zone field, select the check boxes next to the options under which you want to allow modules to be launched:
  
  - Internet
  - Local intranet
  - Trusted sites
  - Restricted sites
  - Computer

These settings are only applicable to Internet Explorer®.

8. Click OK.

The process is added to the task protection scope.
## Exploit prevention techniques

</tbody>
</table>

About hierarchical storage

The Hierarchical Storage Management system (hereinafter referred to as "HSM system") allows data relocation between fast local drives and slow long-term data storage devices. Despite evident advantages of fast data storage devices, they tend to be too expensive for most organizations. HSM systems transfer unused data to inexpensive remote data storage devices thus minimizing corporate expenses.

HSM systems preserve some data in remote storage areas restoring the information, if necessary. HSM systems constantly monitor file access detecting which files can safely be moved to remote storage and which should be preserved locally. Files are relocated to remote storage if no requests to access them are made for a certain specified time period. If a user accesses a file stored remotely, the file is transferred back to the local drive. That approach ensures that users can quickly access large data volume considerably exceeding available disk space.

While moving a file from local drive to remote storage, HSM system saves a link to the actual location of the file. Whenever a file containing the link is accessed, the system determines the data location on the backup device. Replacement of actual files with links to the locations where they are stored allows creation of storage areas of practically unlimited size.

Some HSM systems support local storage of file portions. In that case larger portion of file data is transferred to remote storage while local storage retains just a small part of the original file.

HSM systems use two methods to access the data in hierarchical storage:

- Reparse points.
- Extended file attributes.
Configuring HSM system settings via the Administration Plug-in

If you do not use HSM systems, leave unchanged the default value for the Hierarchical storage access type setting (Non-HSM system).

To configure access to the hierarchical storage, you have to specify the way the HSM system determines the location of the file being scanned. You can find this information in manuals of the HSM system being used.

To define the access type for the hierarchical storage:

1. Expand the Managed devices node in the Kaspersky Security Center Administration Console tree.
2. Select the administration group for which you want to configure the task.
3. Select the Policies tab.
4. Double-click the policy name you want to configure.
5. In the Properties: <Policy name> window that opens, select the Application settings section.
6. In the Scalability and interface subsection, click the Settings button.
   The Advanced application settings window opens.
7. Open the Hierarchical storage tab.
8. Select the option for accessing the HSM system:
   - **Non-HSM system.**
     Kaspersky Security for Windows Server does not use HSM system settings while running On-Demand Scan tasks.
     This option is selected by default.
   - **HSM system uses reparse points.**
     Kaspersky Security for Windows Server uses reparse points for scanning files in a remote storage during On-Demand Scan tasks.
   - **HSM system uses extended file attributes.**
     Kaspersky Security for Windows Server uses extended file attributes to scan files in the remote storage while running the On-Demand Scan task.
   - **Unknown HSM system.**
     Kaspersky Security for Windows Server scans all files as files located in a remote storage during On-Demand Scan tasks.
     This option is not recommended.
If you specify the wrong version or select the Unknown HSM system option, Kaspersky Security for Windows Server can incorrectly determine the location of objects, which will increase the time it takes to process objects.

9. Click OK.

The configured HSM system settings are saved.

Configuring HSM system settings via the Application Console

If you do not use HSM systems, leave unchanged the default value for the Hierarchical storage access type setting (Non-HSM system).

To configure access to the hierarchical storage, you have to specify the way the HSM system determines the location of the file being scanned. You can find this information in manuals of the HSM system being used.

► To define the access type for the hierarchical storage:

1. In the Application Console tree, open the context menu of the Kaspersky Security node.
2. Select Hierarchical storage.

   The HSM system settings window opens.
3. Specify the settings of the HSM system on the Hierarchical storage tab:
   - Non-HSM system.
     Kaspersky Security for Windows Server does not use HSM system settings while running On-Demand Scan tasks.
     This option is selected by default.
   - HSM system uses reparse points.
     Kaspersky Security for Windows Server uses reparse points for scanning files in a remote storage during On-Demand Scan tasks.
   - HSM system uses extended file attributes.
     Kaspersky Security for Windows Server uses extended file attributes to scan files in the remote storage while running the On-Demand Scan task.
   - Unknown HSM system.
     Kaspersky Security for Windows Server scans all files as files located in a remote storage during On-Demand Scan tasks.
     This option is not recommended.
If you specify the wrong version or select the **Unknown HSM system** option, Kaspersky Security for Windows Server can incorrectly determine the location of objects, which will increase the time it takes to process objects.

4. **Click OK.**

The configured HSM system settings are saved.
Integrating with third-party systems

This section describes integration of Kaspersky Security for Windows Server with third-party features and technologies.

In this chapter

- Integrating with WMI .................................................................................................................. 535

This section provides information about Kaspersky Security for Windows Server counters: System Monitor performance counters, and SNMP counters and traps.

In this section

- Performance counters for System Monitor .................................................................................. 519
- Kaspersky Security for Windows Server SNMP counters and traps .............................................. 525

Performance counters for System Monitor

This section contains information about performance counters for the Microsoft Windows System Monitor that are registered by Kaspersky Security for Windows Server during installation.

In this section

- About Kaspersky Security for Windows Server SNMP counters ............................................... 520
- Total number of denied requests .................................................................................................. 520
- Total number of skipped requests .............................................................................................. 521
- Number of requests not processed because of lack of system resources ..................................... 522
- Number of requests sent to be processed................................................................................... 522
- Average number of file interception dispatcher streams .............................................................. 523
- Maximum number of file interception dispatcher streams ........................................................... 523
- Number of elements in infected objects queue .......................................................................... 524
- Number of objects processed per second .................................................................................... 525
About Kaspersky Security for Windows Server SNMP counters

Using Kaspersky Security for Windows Server counters, you can monitor the application's performance while Real-Time Protection tasks are running. You can uncover tight places when it is running with other applications and resource shortages. You can diagnose undesirable Kaspersky Security for Windows Server settings and crashes in its operation.

You can view Kaspersky Security for Windows Server performance counters by opening the **Performance** console in the **Administration** item of Windows Control Panel.

The following sections list definitions of counters, recommended intervals for taking readings, threshold values, and recommendations for Kaspersky Security for Windows Server settings if the counter values exceed them.

**Total number of denied requests**

<table>
<thead>
<tr>
<th>Name</th>
<th>Total number of requests denied</th>
</tr>
</thead>
<tbody>
<tr>
<td>Definition</td>
<td>Total number of requests denied from the file interception driver to process objects that were not accepted by the application processes; counted from the time Kaspersky Security for Windows Server was last started. The application skips objects for which requests for processing are denied by Kaspersky Security for Windows Server processes.</td>
</tr>
</tbody>
</table>
| Purpose                                   | This counter can help you detect:  
  - Interruption of Real-Time Protection because of file interception dispatcher failures. |
| Normal / threshold value                   | 0 / 1.                          |
| Recommended reading interval              | 1 hour.                         |
| Recommendations for configuration if value exceeds the threshold | The number of requests for processed denied corresponds to the number of skipped objects. The following situations are possible depending on counter behavior:  
  - the counter shows several requests denied over extended period of time: all Kaspersky Security for Windows Server processes are fully loaded so Kaspersky Security for Windows Server could not scan objects. To avoid skipping objects, increase the number of application processes for Real-Time Protection tasks. You can use such settings of Kaspersky Security for Windows Server as **Maximum number of active processes** and **Number of processes for real-time protection**.  
  - The number of request denied significantly exceeds the critical threshold and is growing quickly: the file interception dispatcher has crashed. Kaspersky Security for Windows Server is not scanning objects on access. Restart Kaspersky Security for Windows Server. |
Total number of skipped requests

Table 73. Total number of skipped requests

<table>
<thead>
<tr>
<th>Name</th>
<th>Total number of requests skipped</th>
</tr>
</thead>
<tbody>
<tr>
<td>Definition</td>
<td>The total number of requests from the file interception driver to process objects that have been received by Kaspersky Security for Windows Server but have not generated events of processing completion; this number is counted starting from the moment application was last started. If a request for processing of such object accepted by one of the work processes did not send an event for completion of the processing, the driver will transfer such request to another process and the value of counter <code>Total Number of Skipped Requests</code> will increment by 1. If the driver has gone through all of the working processes and none of them has received the request for processing (was busy) or has sent events of processing completion, Kaspersky Security for Windows Server will skip such object, so the value of counter <code>Total Number of Skipped Requests</code> will increment by 1.</td>
</tr>
<tr>
<td>Purpose</td>
<td>This counter enables you to detect drops in performance because of file interception dispatcher failures.</td>
</tr>
<tr>
<td>Normal / threshold value</td>
<td>0 / 1</td>
</tr>
<tr>
<td>Recommended reading interval</td>
<td>1 hour</td>
</tr>
<tr>
<td>Recommendations for configuration if value exceeds the threshold</td>
<td>If the counter value is anything other than zero, this means that one or several file interception dispatcher streams have frozen and are down. The counter value corresponds to the number of streams currently down. If the scan speed is not satisfactory, restart Kaspersky Security for Windows Server to restore the off-line streams.</td>
</tr>
</tbody>
</table>
### Number of requests not processed because of lack of system resources

**Table 74. Number of requests not processed because of lack of system resources**

<table>
<thead>
<tr>
<th>Name</th>
<th>Definition</th>
<th>Purpose</th>
<th>Normal / threshold value</th>
<th>Recommended reading interval</th>
<th>Recommendations for configuration if value exceeds the threshold</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Number of requests not processed due to lack of resources.</td>
<td>Total number of requests from the file interception driver which were not processed because of a lack of system resources (for example, RAM); counted from the time Kaspersky Security for Windows Server was last started. Kaspersky Security for Windows Server skips objects requests to process which are not processed by the file interception driver.</td>
<td>0 / 1.</td>
<td>1 hour.</td>
<td>If the counter value is anything other than zero, Kaspersky Security for Windows Server working processes need more RAM to process requests. Active processes of other applications may be using all available RAM.</td>
</tr>
</tbody>
</table>

### Number of requests sent to be processed

**Table 75. Number of requests sent to be processed**

<table>
<thead>
<tr>
<th>Name</th>
<th>Definition</th>
<th>Purpose</th>
<th>Normal / threshold value</th>
<th>Recommended reading interval</th>
<th>Recommendations for configuration if value exceeds the threshold</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Number of requests sent to be processed.</td>
<td>The number of objects that wait for processing by working processes.</td>
<td>The counter value may vary depending on the level of file activity on the server.</td>
<td>1 minute</td>
<td>No</td>
</tr>
</tbody>
</table>
## Average number of file interception dispatcher streams

**Table 76. Average number of file interception dispatcher streams**

<table>
<thead>
<tr>
<th>Name</th>
<th>Average number of file interception dispatcher streams.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Definition</td>
<td>The number of file interception dispatcher streams in one process and the average for all processes currently involved in Real-Time Protection tasks.</td>
</tr>
<tr>
<td>Purpose</td>
<td>This counter can be used to detect and eliminate potentially lower quality in Real-Time Protection that occurs because of full load on Kaspersky Security for Windows Server processes.</td>
</tr>
<tr>
<td>Normal / threshold value</td>
<td>Varies / 40</td>
</tr>
<tr>
<td>Recommended reading interval</td>
<td>1 minute</td>
</tr>
<tr>
<td>Recommendations for configuration if value exceeds the threshold</td>
<td>Up to 60 file interception dispatcher streams can be created in each working process. If the counter value approaches 60, there is a risk that none of the working processes will be able to process the next request in queue from the file interception driver and Kaspersky Security for Windows Server will skip the object. Increase the number of Kaspersky Security for Windows Server processes for Real-Time Protection tasks. You can use such Kaspersky Security for Windows Server settings as <strong>Maximum number of active processes</strong> and <strong>Number of processes for real-time protection</strong>.</td>
</tr>
</tbody>
</table>

## Maximum number of file interception dispatcher streams

**Table 77. Maximum number of file interception dispatcher streams**

<table>
<thead>
<tr>
<th>Name</th>
<th>Maximum number of file interception dispatcher streams.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Definition</td>
<td>The number of file interception dispatcher streams in one process and the maximum for all processes currently involved in Real-Time Protection tasks.</td>
</tr>
<tr>
<td>Purpose</td>
<td>This counter enables you to detect and eliminate drops in performance because of uneven distribution of loads in running processes.</td>
</tr>
<tr>
<td>Normal / threshold value</td>
<td>Varies / 40</td>
</tr>
<tr>
<td>Recommended reading interval</td>
<td>1 minute</td>
</tr>
<tr>
<td>Recommendations for configuration if value exceeds the threshold</td>
<td>If the value of this counter significantly and continuously exceeds the following of the <strong>Average number of file interception dispatcher streams</strong> counter, Kaspersky Security for Windows Server is distributing the load to running processes unevenly. Restart Kaspersky Security for Windows Server.</td>
</tr>
</tbody>
</table>
Number of elements in infected objects queue

<table>
<thead>
<tr>
<th>Name</th>
<th>Number of items in the infected objects queue.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Definition</td>
<td>Number of infected objects currently waiting to be processed (disinfected or deleted).</td>
</tr>
</tbody>
</table>
| Purpose                     | This counter can help you detect:  
  - Interruption of Real-Time Protection because of possible file interception dispatcher failures.  
  - Overload of processes because of uneven distribution of processor time between different working processes and Kaspersky Security for Windows Server.  
  - Virus outbreaks. |
| Normal / threshold value    | This value may be something other than zero while Kaspersky Security for Windows Server is processing infected or probably infected objects but will return to zero after processing is finished / The value remains non-zero for an extended period of time. |
| Recommended reading interval| 1 minute                                        |
| Recommendations for configuration if value exceeds the threshold | If the value of the counter does not return to zero for an extended period of time:  
  - Kaspersky Security for Windows Server is not processing objects (the file interception dispatcher may have crashed). Restart Kaspersky Security for Windows Server.  
  - Not enough processor time to process the objects. Make sure Kaspersky Security for Windows Server receives additional processor time (by lowering other applications' load on the server, for example).  
  - There has been a virus outbreak.  
  A large number of infected or probably infected objects in the Real-Time File Protection task also is a sign of a virus outbreak. You can view information about the number of detected objects in the task statistics or task logs. |
## Number of objects processed per second

<table>
<thead>
<tr>
<th>Name</th>
<th>Definition</th>
<th>Purpose</th>
<th>Normal / threshold value</th>
<th>Recommended reading interval</th>
<th>Recommendations for configuration if value exceeds the threshold</th>
</tr>
</thead>
</table>
| Name | Number of objects processed per second. | Number of objects processed divided by the amount of time that it took to process those objects (calculated over equal time intervals). | This counter reflects the speed of object processing; it can be used to detect and eliminate low points in server performance that occur because of insufficient processor time being allotted to Kaspersky Security for Windows Server processes or errors in Kaspersky Security for Windows Server operation. | Varies / No. | The values of this counter depend on the values set in Kaspersky Security for Windows Server settings and the load on the server from other applications' processes. Observe the average level of counter numbers over an extended period of time. If the general level of the counter values becomes lower, one of the following situations is possible:  
- Kaspersky Security for Windows Server processes do not have enough processor time to process the objects. Make sure Kaspersky Security for Windows Server receives additional processor time (by lowering other applications' load on the server, for example).  
- Kaspersky Security for Windows Server has experienced an error (several streams are idle). Restart Kaspersky Security for Windows Server. |
| Definition | | | | | |
| Purpose | | | | | |

## Kaspersky Security for Windows Server SNMP counters and traps

This section contains information about Kaspersky Security for Windows Server counters and traps.

### In this section

- About Kaspersky Security for Windows Server SNMP counters and traps ........................................ 526
- Kaspersky Security for Windows Server SNMP counters ........................................................................ 526
- Kaspersky Security for Windows Server SNMP traps ........................................................................... 529
About Kaspersky Security for Windows Server SNMP counters and traps

If you have included SNMP Counters and Traps in the set of Anti-Virus components to be installed, you can view Kaspersky Security for Windows Server counters and traps using Simple Network Management Protocol (SNMP).

To view Kaspersky Security for Windows Server counters and traps from the administrator's workstation, start SNMP Service on the protected server and start SNMP and SNMP Trap Services on the administrator's workstation.

Kaspersky Security for Windows Server SNMP counters

This section contains tables with a description of the settings for Kaspersky Security for Windows Server SNMP counters.

Kaspersky Security for Windows Server SNMP traps

The options of SNMP traps in Kaspersky Security for Windows Server are summarized as follows:

- **eventThreatDetected**: an object has been detected.
  
  The options of the trap are as follows:
  
  - eventDateAndTime
  - eventSeverity
  - computerName
  - userName
  - objectName
  - threatName
  - detectType
  - detectCertainty

- **eventBackupStorageSizeExceeds**: maximum Backup size exceeded. The total size of data in Backup has exceeded the value specified by the **Maximum Backup size (MB)**. Kaspersky Security for Windows Server continues to back up infected objects.

  The options of the trap are as follows:
  
  - eventDateAndTime
  - eventSeverity
  - eventSource

- **eventThresholdBackupStorageSizeExceeds**: Backup free space threshold reached. The amount of free size in Backup assigned by the **Threshold value for space available (MB)** is equal to or less than the specified value. Kaspersky Security for Windows Server continues to back up infected objects.

  The options of the trap are as follows:
  
  - eventDateAndTime
  - eventSeverity
  - eventSource

- **eventQuarantineStorageSizeExceeds**: maximum Quarantine size exceeded. The total size of data in Quarantine has exceeded the value specified by the **Maximum Quarantine size (MB)**. Kaspersky Security for Windows Server continues to quarantine probably infected objects.

  The options of the trap are as follows:
  
  - eventDateAndTime
  - eventSeverity
  - eventSource

- **eventObjectNotQuarantined**: Quarantine error.

  The options of the trap are as follows:
  
  - eventSeverity
  - eventDateAndTime
• eventSource
• userName
• computerName
• objectName
• storageObjectNotAddedEventReason

• eventObjectNotBackuped: Error of saving an object copy in the Backup.
The options of the trap are as follows:
  • eventSeverity
  • eventDateAndTime
  • eventSource
  • objectName
  • userName
  • computerName
  • storageObjectNotAddedEventReason

• eventQuarantineInternalError: Quarantine internal error.
The options of the trap are as follows:
  • eventSeverity
  • eventDateAndTime
  • eventSource
  • eventReason

• eventBackupInternalError: Backup error.
The options of the trap are as follows:
  • eventSeverity
  • eventDateAndTime
  • eventSource
  • eventReason

• eventAVBasesOutdated: Anti-virus database is out of date. Number of days since the last execution of
database update task (local task, or group task, or task for sets of computers) is being calculated.
The options of the trap are as follows:
  • eventSeverity
  • eventDateAndTime
  • eventSource
  • days
• eventAVBasesTotallyOutdated: Anti-virus database is obsolete. Number of days since the last execution of database update task (local task, or group task, or task for sets of computers) is being calculated.
  The options of the trap are as follows:
  • eventSeverity
  • eventDateAndTime
  • eventSource
  • days

• eventApplicationStarted: Kaspersky Security for Windows Server is running.
  The options of the trap are as follows:
  • eventSeverity
  • eventDateAndTime
  • eventSource

• eventApplicationShutdown: Kaspersky Security for Windows Server is stopped.
  The options of the trap are as follows:
  • eventSeverity
  • eventDateAndTime
  • eventSource

• eventCriticalAreasScanWasntPerformForALongTime: Critical areas have not been scanned for a long time. Calculated as the number of days since the last completion of the Critical Areas Scan task.
  The options of the trap are as follows:
  • eventSeverity
  • eventDateAndTime
  • eventSource
  • days

• eventLicenseHasExpired: License has expired.
  The options of the trap are as follows:
  • eventSeverity
  • eventDateAndTime
  • eventSource

• eventLicenseExpiresSoon: License expires soon. Calculated as the number of days until the expiration date for the license.
  The options of the trap are as follows:
  • eventSeverity
  • eventDateAndTime
  • eventSource
  • days
• eventTaskInternalError: Task completion error.
The options of the trap are as follows:
  • eventSeverity
  • eventDateAndTime
  • eventSource
  • errorCode
  • knowledgeBaseId
  • taskName
• eventUpdateError: Error of update task performance.
The options of the trap are as follows:
  • eventSeverity
  • eventDateAndTime
  • taskName
  • updaterErrorEventReason

Descriptions of the traps options and their possible parameter values are as follows:

• eventDateAndTime: event date and time.
• eventSeverity: importance level.
The option can take the following values:
  • critical (1) – critical
  • warning (2) – warning
  • info (3) – informational
• userName: a user name (for example, name of the user that attempted to gain access to an infected file).
• computerName: server name (for example, name of the server from which a user attempted to gain access to an infected file).
• eventSource: functional component where the event was generated.
The option can take the following values:
  • unknown (0) – functional component not known
  • quarantine (1) – Quarantine
  • backup (2) – Backup
  • reporting (3) – task logs
  • updates (4) – Update
  • realTimeProtection (5) – Real-Time File Protection
  • onDemandScanning (6) – On-Demand Scan
  • product (7) – event related to operation of Kaspersky Security for Windows Server as a whole rather than operation of individual components
  • systemAudit (8) – system audit log
• **eventReason:** event trigger: what provoked the event. The option can take the following values:
  - `reasonUnknown(0)` – reason is unknown
  - `reasonInvalidSettings (1)` – only for a Backup and Quarantine events, displayed if Quarantine or Backup is unavailable (insufficient access permissions or the folder is specified incorrectly in the Quarantine settings -- for example, a network path is specified). In this case, Kaspersky Security for Windows Server will use the default Backup or Quarantine folder.

• **objectName:** an object name (for example, name of the file where the virus was detected).

• **threatName:** The name of the object according to the Virus Encyclopedia [https://encyclopedia.kaspersky.com/knowledge/classification/](https://encyclopedia.kaspersky.com/knowledge/classification/) classification. This name is included in the full name of the detected object that Kaspersky Security for Windows Server returns on detecting an object. You can view the full name of a detected object in the task log (see Section "Configuring log settings" on page 107).

• **detectType:** type of object detected. The option can take the following values:
  - `undefined (0)` – undefined
  - `virware` – classic viruses and network worms
  - `trojware` – Trojans
  - `malware` – other malicious programs
  - `adware` – advertising software
  - `pornware` – pornographic software
  - `riskware` – legitimate applications that may be used by intruders to damage the user’s computer or personal data

• **detectCertainty:** certainty level for threat detection. The option can take the following values:
  - `Suspicion (probably infected)` – Kaspersky Security for Windows Server has detected a partial match between a section of the object code and the known malicious code section.
  - `Sure (infected)` – Kaspersky Security for Windows Server has detected a complete match between a section of the object code and the known malicious code section.

• **days:** number of days (for example, the number of days until the license expiration date).

• **errorCode:** an error code.

• **knowledgeBaseId:** address of a knowledge base article (for example, address of an article that explains a particular error).

• **taskName:** a task name.

• **updaterErrorEventReason:** a reason of the update error. The option can take the following values:
  - `reasonUnknown(0)` – reason is unknown
  - `reasonAccessDenied` – access denied
  - `reasonUrlsExhausted` – the list of update sources is exhausted
Integrating with third-party systems

- reasonInvalidConfig – invalid configuration file
- reasonInvalidSignature – invalid signature
- reasonCantCreateFolder – folder cannot be created
- reasonFileOperError – file error
- reasonDataCorrupted – object is corrupted
- reasonConnectionReset – connection reset
- reasonTimeOut – connection timeout exceeded
- reasonProxyAuthError – proxy authentication error
- reasonServerAuthError – server authentication error
- reasonHostNotFound – computer not found
- reasonServerBusy – server unavailable
- reasonConnectionError – connection error
- reasonModuleNotFound – object not found
- reasonBlstCheckFailed(16) – error checking the black list of keys. It is possible that databases updates were being published at the moment of update; please repeat the update in a few minutes.

storageObjectNotAddedEventReason: the reason why the object was not backed up or quarantined.

The option can take the following values:

- reasonUnknown(0) – reason is unknown
- reasonStorageReadOnly – database is read-only; Kaspersky Security for Windows Server must be restored.
- reasonStorageCorrupted – storage is corrupted; Kaspersky Security for Windows Server must be restored.
- reasonStorageFull – database is full; please free up disk space.
- reasonStorageOpenError – database file could not be opened; Kaspersky Security for Windows Server must be restored.
- reasonStorageOSFeatureError – some operating system features do not correspond to Kaspersky Security for Windows Server requirements.
- reasonObjectNotFound – object being placed to Quarantine does not exist on the disk.
- reasonObjectAccessError – insufficient permissions to use Backup API: the account being used to perform the operation does not have Backup Operator permissions.
- reasonDiskOutOfSpace – not enough space on the disk.
Integrating with WMI

Kaspersky Security for Windows Server supports integration with Windows Management Instrumentation (WMI): you can use client systems that use WMI to receive data via the Web-Based Enterprise Management (WBEM) standard in order to gather information about the status of Kaspersky Security for Windows Server and its components.

When Kaspersky Security for Windows Server is installed, it registers proprietary module on the system, which facilitates the creation of a Kaspersky Security for Windows Server namespace the WMI root namespace on the local computer. A Kaspersky Security for Windows Server namespace lets you work with Kaspersky Security for Windows Server classes and instances and their properties.

The values of some instance properties depend on task types.

**Non-periodic task** is an application task that is not limited in time and can either be constantly running or stopped. No execution progress exists for such tasks. The results of task execution are logged non-stop while the task is running as a single events (for example, detection of an infected object by any of Real-Time Server Protection tasks). This type of tasks is managed via the Kaspersky Security Center policies.

**Periodic task** is an application task that is limited in time and has an execution progress displayed in percentage. The task results are generated upon the task completion and are represented as a single item or changed application state (for example, completed application database update, generated configuration files for the rule generation tasks). A number of periodic tasks of the same type can be running on a single computer simultaneously (three On-Demand scan tasks with different scan scopes). Periodic tasks can be managed via Kaspersky Security Center as group tasks.

If you use tools for generating WMI namespace queries and receiving dynamic data from WMI namespaces on your corporate network, you will be able to receive the information about the current application state (see the table below).

Table 86. Information about the application state

<table>
<thead>
<tr>

</tr>
</tbody>
</table>
| LicenseDaysLeft                   | Shows how many days are left before a current license expiration.            | Number of days remaining before expiration of the current license. Possible non-positive values:  
  - 0 - License has expired  
  - -1 - Unable to get information on the current key or the specified key cannot be used to activate the application (for example, it is blocked based on a blacklist of keys).                                                                                                                                                                                                                     |
| AVBasesDatetime                   | The timestamp for a current anti-virus database version.                     | Date and time of the creation of the anti-virus databases currently in use. If the installed application does not use anti-virus databases, then the field has the value “Not installed”.                                                                                                                                                                                                                                                                                                                                                                     |
| IsExploitPreventionEnabled        | The Exploit Prevention component state.                                     | Status of the Exploit Prevention component. Possible values:  
  - True - The Exploit Prevention component is enabled and providing protection.  
  - False - The Exploit Prevention component is not providing protection. For example: disabled, not installed, the License Agreement has been violated.                                                                                                                                                                                                                                                   |
| ProtectionTasksRunning            | The array of protection tasks that are currently running.                   | List of protection, control, and monitoring tasks currently running. This field should account for all running non-periodic tasks. If not one non-periodic task is running, the field has the value “No”.                                                                                                                                                                                                                                                                                                                                                       |
| IsAppControlRunning               | The Applications Launch Control task state.                                 | Status of the Applications Launch Control task.  
  - True - The Applications Launch Control task is currently running.  
  - False - The Applications Launch Control is not currently running or the Applications Launch Control component is not installed.                                                                                                                                                                                                                                                                                                                                                           |

</tbody>
</table>

This data represents instance properties KasperskySecurity_ProductInfo.ProductName=Kaspersky Security, where:

- KasperskySecurity_ProductInfo is the name of the Kaspersky Security for Windows Server class
- .ProductName=Kaspersky Security is the Kaspersky Security for Windows Server key parameter

The instance is created in the ROOT\Kaspersky\Security namespace.
Working with Kaspersky Security for Windows Server from the command line

This section describes working with Kaspersky Security for Windows Server from the command line.

In this chapter

- Command line commands .......................................................... 538
- Command line return codes ........................................................ 564

Command line commands

You can perform basic Kaspersky Security for Windows Server management commands from the command line of the protected server if you included the Command line utility component into the list of installed features during installation of Kaspersky Security for Windows Server.

Using command line commands you can manage only those functions which are accessible to you based on the permissions assigned to you in Kaspersky Security for Windows Server.

Certain Kaspersky Security for Windows Server commands are executed in the following modes:

- Synchronous mode: management returns to the Console only after command execution is complete.
- Asynchronous mode: management returns to the Console immediately after the command is run.

▶ To interrupt command execution in synchronous mode

press the Ctrl+C keyboard shortcut.

Follow the following rules when entering Kaspersky Security for Windows Server commands:

- Enter modifiers and commands using upper and lower case.
- Delimit modifiers with the space character.
- if the file/folder name whose path you specify as the key value contains a space, specify the file/folder path in quotes, for example: "C:\TEST\test.cpp.exe"
- if necessary, use placeholders in the filename or path masks, for example: “C:\Temp\Temp*”, “C:\Temp\Temp????.doc”, “C:\Temp\Temp*.doc”

You can use the command line for the entire range of operations required for management and administration of Kaspersky Security for Windows Server (see the table below).

Displaying Kaspersky Security for Windows Server command help. **KAVSHELL HELP**

To obtain the list of all Kaspersky Security for Windows Server commands, run one of the following commands:

```
KAVSHELL
KAVSHELL HELP
KAVSHELL /?
```

To obtain a description of a command and its syntax, run one of the following commands:

```
KAVSHELL HELP <command>
KAVSHELL <command> /?
```

**KAVSHELL HELP command examples**

To view detailed information about the KAVSHELL SCAN command, execute the following command:

```
KAVSHELL HELP SCAN
```

Starting and stopping Kaspersky Security service **KAVSHELL START**, **KAVSHELL STOP**

To run the Kaspersky Security Service, execute the command

```
KAVSHELL START
```

By default when Kaspersky Security Service is started, tasks Real-Time File Protection and Scan at system startup as well as other tasks that are scheduled to start **At application launch** will be started.

To stop the Kaspersky Security Service, execute command

```
KAVSHELL STOP
```

Password might be required to execute the command. To enter the current password use [\pwd:<password>]} key.
Scanning selected area. KAVSHELL SCAN

In order to start a task for scanning specific areas of the protected server use command KAVSHELL SCAN. The command modifiers specify the scan scope and security settings of the selected node.

The On-Demand Scan task started using KAVSHELL SCAN command is a temporary task. It is displayed in the Application Console only while being executed (you cannot view task settings in the Application Console). The task performance log is generated at the same time. It is displayed in the Task logs of the Application Console.

When specifying paths in scan tasks for specific areas, you can use environmental variables. If you use environmental variable specified for user, execute KAVSHELL SCAN command with the permissions for this user.

Command KAVSHELL SCAN is executed in the synchronous mode.

To start an existing On-Demand Scan task from the command line, use the KAVSHELL TASK (see Section "Managing specified task asynchronously. KAVSHELL TASK" on page 546) command.

KAVSHELL SCAN command syntax

KAVSHELL SCAN <scan scope>
[/MEMORY|/SHARED|/STARTUP|/REMDRIVES|/FIXDRIVES|/MYCOMP] [/L:< path to file with the list of scan scopes >] [/F<A|C|E>] [/NEWONLY]
[/AI:<DISINFECT|DISINFDEL|DELETE|REPORT|AUTO>]
[/OF:<SKIP|RESIDENT|SCAN[=<days>] [NORECALL]>]

The KAVSHELL SCAN command has both mandatory and optional keys (see table below).

KAVSHELL SCAN command examples

KAVSHELL SCAN Folder56 D:\Folder1\Folder2\Folder3\ C:\Folder1\C:\Folder2\Folder3\3.exe “\another server\Shared” F:\123\*.fgb /SHARED
/AI:DISINFDEL /AS:QUARANTINE /FA /E:ABM /EM:”*.xtx;*.fff;*.ggg;*.bbb;*.info”
/NOICHECKER /ANALYZERLEVEL:1 /NOISWIFT /W:log.log
KAVSHELL SCAN /L:scan_objects.lst /W:c:\log.log

<tbody>
<tr>
<td>/ANALYZERLEVEL:&lt;analysis intensity&gt;</td>
<td>Enable Heuristic Analyzer, configure analysis level. The following heuristic analysis levels are available: 1 – light 2 – medium 3 – deep If you omit the modifier, Kaspersky Security for Windows Server will not use heuristic analyzer.</td>
</tr>
<tr>
<td>/ALIAS:&lt;task alias&gt;</td>
<td>Enables you to assign an On-Demand Scan task a temporary name by which the task can be accessed during its execution, for example in order to view its statistics using TASK command. The task alias must be unique among the task aliases of all functional components of Kaspersky Security for Windows Server. If this modifier is not specified, temporary name scan_&lt;kavshell_pid&gt; is used, for example, scan_1234. In the Application Console, the task is assigned the name Scan objects (&lt;date and time&gt;), for example, Scan objects 8/16/2007 5:13:14 PM.</td>
</tr>
<tr>
<td>/W:&lt;path to task log file&gt;</td>
<td>If this key is specified, Kaspersky Security for Windows Server will save the task log file with the name defined by the key’s value. The log file contains task execution statistics, the time when it was started and completed (stopped), and information about events in this task. The log is used to register events defined by the settings of task logs and the Kaspersky Security for Windows Server event log in the Event Viewer. Either the absolute or relative path to the log file can be specified. If you specify only the name of a file without specifying the respective path, the log file will be created in the current folder. Restarting the command with the same log settings will overwrite the existing log file. The log file can be viewed while a task is running. The log appears in the Task logs node of the Application Console. If Kaspersky Security for Windows Server fails to create the log file, it will not stop the command from executing but it will display an error message.</td>
</tr>
<tr>
<td>/ANSI</td>
<td>The option enables recording of events to task log in the ANSI encoding. The ANSI option will not be applied, if the W option is not defined. If the ANSI option is not specified, task log is generated using the UNICODE encoding.</td>

Managing specified task asynchronously. KAVSHELL TASK

Using KAVSHELL TASK command you can manage the specified task: run, pause, resume and stop the specified task and view the current task status and statistics. The command is performed in asynchronous mode.

Password might be required to execute the command. To enter the current password use [/pwd:<password>] key.
KAVSHELL TASK command syntax
KAVSHELL TASK [<task name alias> </START | /STOP | /PAUSE | /RESUME | /STATE | /STATISTICS >]

KAVSHELL TASK command examples
KAVSHELL TASK
KAVSHELL TASK on-access /START
KAVSHELL TASK user-task_1 /STOP
KAVSHELL TASK scan-computer /STATE

KAVSHELL TASK command can run without modifiers or with one/several modifiers (see the table below).

<table>
<thead>
<tr>
<th>Key</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Without keys</td>
<td>Returns the list of all existing Kaspersky Security for Windows Server tasks</td>
</tr>
<tr>
<td></td>
<td>The list contains the fields: alternative task name, task category (system or custom) and current task status.</td>
</tr>
<tr>
<td>&lt;task alias&gt;</td>
<td>Instead of the task name, in the SCAN TASK command, use its Task alias, an additional short-form name that Kaspersky Security for Windows Server assigns to tasks. To view Kaspersky Security for Windows Server task aliases enter the command KAVSHELL TASK without any modifiers</td>
</tr>
<tr>
<td>/START</td>
<td>Starts the specified task in asynchronous mode.</td>
</tr>
<tr>
<td>/STOP</td>
<td>Stops the specified task.</td>
</tr>
<tr>
<td>/PAUSE</td>
<td>Pauses the specified task.</td>
</tr>
<tr>
<td>/RESUME</td>
<td>Resumes the specified task in asynchronous mode.</td>
</tr>
<tr>
<td>/STATE</td>
<td>Returns the current task status (for example, Running, Completed, Paused, Stopped, Failed, Starting, Recovering).</td>
</tr>
<tr>
<td>/STATISTICS</td>
<td>Retrieve task statistics - information on the number of objects processed from the time the task started until now.</td>
</tr>
</tbody>
</table>

Table 90.  KAVSHELL TASK command modifiers

Return codes for the KAVSHELL TASK command (see Section "Return codes for KAVSHELL TASK command" on page 567).
Registering KAVFS as a system protected process. KAVSHELL CONFIG

The **KAVSHELL CONFIG** command allows you to control the registration of the Kaspersky Security Service as a system protected process (Protected Process Light) using the ELAM driver, installed in the operating system during the application installation.

**KAVSHELL CONFIG command syntax**

KAVSHELL CONFIG /PPL:<ON|OFF>

<table>
<thead>
<tr>
<th>Key</th>

Managing the Applications Launch Control task KAVSHELL APPCONTROL /CONFIG

You can use the KAVSHELL APPCONTROL /CONFIG command to configure the mode in which the Applications Launch Control task runs and monitors the loading of DLL modules.

KAVSHELL APPCONTROL /CONFIG command syntax

```
/config /mode:<applyrules|statistics> [/dll:<no|yes>] | /config
/savetofile:<full path to XML file>
```

KAVSHELL APPCONTROL /CONFIG command examples

- To run the Applications Launch Control task in Active mode without loading a DLL and save the task settings upon completion, run the following command:

  ```
  KAVSHELL APPCONTROL /CONFIG /mode:applyrules /dll:<no>
  /savetofile:c:\appcontrol\config.xml
  ```

You can configure Applications Launch Control task settings using the command-line parameters (see the table below).

Table 93. KAVSHELL APPCONTROL /GENERATE command switches

<table>

| /mode:<applyrules|statistics>               | Operating mode of the Applications Launch Control task. You can select one of the following modes:  
|                              | • active - Apply Applications Launch Control rules;  
|                              | • statistics - Only statistics.                                             |
| /dll:<no|yes>                      | Enable or disable monitoring of DLL loading.                                |
| /savetofile: <path to XML file> | Export specified rules in the indicated file in XML format.                  |
| /savetofile: <the fullname to xml file> | Save the list of rules to file.                                            |
| /savetofile: <the fullname to xml file> /sdc  | Save the list of Software Distribution Control rules to file.              |
| /clearsdc                     | Delete all Software Distribution Control rules from the list.               |
Rule Generator for Applications Launch Control KAVSHELL APPCONTROL /GENERATE

Using the KAVSHELL APPCONTROL /GENERATE command you can generate the Applications Launch Control rules lists.

Password might be required to execute the command. To enter the current password use [/pwd:<password>] key.

KAVSHELL APPCONTROL /GENERATE command syntax

KAVSHELL APPCONTROL /GENERATE command examples

► To generate rules for files from specified folders, execute the following command:

KAVSHELL APPCONTROL /GENERATE /source:c:\folderslist.txt /export:c:\rules\appctrlrules.xml

► To generate rules for executable files of all extensions available in the specified folder and, upon the task completion, save generated rules in the specified file XML file, execute the following command:

KAVSHELL APPCONTROL /GENERATE c:\folder /masks:edms /export:c:\rules\appctrlrules.xml

Depending on keys syntax you can configure automatic rules generation settings for the Applications Launch Control task (see table below).

Table 94. KAVSHELL APPCONTROL /GENERATE command keys

<table>
<thead>
<tr>
<th>Key</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;path to folder&gt;</td>
<td>Specifies path to folder with executable files that require automatically generated allowing rules.</td>
</tr>

<td>Specifies path to TXT file with list of folders containing executable files that require automatically generated allowing rules.</td>
</tr>
</tbody>
</table>
### Working with Kaspersky Security for Windows Server from the command line

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| /masks: <edms> | Specifies extensions of executable files that require automatically generated allowing rules. You can include into rules usage scope files of following extensions:  
  - e - EXE files  
  - d - DLL files  
  - m - MSI files  
  - s - scripts |
| /runapp | When generation allowing rules, takes into account applications running on a protected server at the moment of the task performing. |
| /rules: <ch|cp|h> | Specifies actions to perform during the Applications Launch Control allowing rules generation:  
  - ch - use digital certificate. If the certificate is missing, use SHA256 hash.  
  - cp - use digital certificate. If the certificate is missing, use the path to executable file.  
  - h - use SHA256 hash. |
| /strong | Use digital certificate subject and thumbprint while automatically generating the Applications Launch Control allowing rules. The command is executed if the /rules: <ch|cp> key is specified. |
| /user: <user or group of users> | Specifies user name or a group of users for which the rules will be applied. The application will monitor any applications run by the specified user and / or group of users. |
| /export: <path to XML file> | Saves generated rules into XML file. |
| /unique | Add information about the server with applications installed that are the base for the Applications Launch Control allowing rules generation. |
| /prefix: <prefix for rules names> | Specifies name prefix for the generating applications launches control allowing rules. |
| /import: <a|r|m> | Imports generated rules to the list of specified applications launch control rules according to the selected adding principle:  
  - a - Add to existing rules (rules with identical settings are duplicated)  
  - r - Replace existing rules (rules with identical parameters are not added; the rule is added if at least one rule parameter is unique)  
  - m - Merge with existing rules (rules with identical parameters are not added; the rule is added if at least one rule parameter is unique) |
Filling list of Applications Launch Control rules KAVSHELL APPCONTROL

Using the KAVSHELL APPCONTROL you can add rules from the XML file to the Applications Launch Control task rules list according to the selected principle and also delete all set rules from the list.

Password might be required to execute the command. To enter the current password use [/pwd:<password>] key.

KAVSHELL APPCONTROL command syntax

KAVSHELL APPCONTROL /append <path to XML file> | /replace <path to XML file> | /merge <path to XML file> | /clear

KAVSHELL APPCONTROL command examples

► To add rules from an XML file to already specified rules for the Applications Launch Control task according to Add to existing rules principle, execute the following command:

KAVSHELL APPCONTROL /append c:\rules\appctrlrules.xml

Depending on the keys syntax, you can select principle to add new rules an XML file specified to a list of the Applications Launch Control defined rules (see table below).

Table 95. KAVSHELL APPCONTROL command keys

<table>
<thead>

</tbody>
</table>
Starting Kaspersky Security for Windows Server databases update task. KAVSHELL UPDATE

The KAVSHELL UPDATE command can be used to start the Kaspersky Security for Windows Server databases update command in the synchronous mode.

The Kaspersky Security for Windows Server databases update task, run using a KAVSHELL UPDATE command, is a temporary task. It is only displayed in the Application Console while being executed. The task log is generated at the same time. It is displayed in the Task logs of the Application Console. Kaspersky Security Center policies may apply to update tasks created and started using the KAVSHELL UPDATE command and update tasks created in the Application Console. For information about managing Kaspersky Security for Windows Server on computers using Kaspersky Security Center, refer to the section "Managing Kaspersky Security for Windows Server using Kaspersky Security Center".

Environment variables can be used when specifying the path to updates source in this task. If a user’s environment variables are used, execute the KAVSHELL UPDATE command with the permissions for this user.

KAVSHELL UPDATE command syntax

The KAVSHELL UPDATE command has both mandatory and optional keys (see the following table).

KAVSHELL UPDATE command examples

► To start a custom database update task, execute the following command:

KAVSHELL UPDATE

► To run the database update task using the update files in the \server\databases network folder, run the following command:

KAVSHELL UPDATE \\server\databases

► To start an update task from the FTP server ftp://dnl-ru1.kaspersky-labs.com/ and write all task events to the c:\update_report.log file, execute the command:

► In order to download Kaspersky Security for Windows Server database updates from Kaspersky Lab’s update server, connect to the updates source through a proxy server (proxy server address: proxy.company.com, port: 8080), to access the server using the in-built Microsoft Windows NTLM authentication with user name: inetuser, password: 123456, execute the following command:

### Table 97. **KAVSHELL UPDATE** command keys

<table>
<thead>
<tr>
<th>Key</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Updates source</strong> (mandatory key). Specify one or multiple sources. Kaspersky Security for Windows Server will access the sources in the order in which they are listed. Delimit sources with a space.</td>
<td></td>
</tr>
<tr>
<td>&lt;path in UNC format&gt;</td>
<td>User-defined update source. Path to network update folder in the UNC format.</td>
</tr>
<tr>
<td>&lt;URL&gt;</td>
<td>User-defined updates source. HTTP or FTP server address where update folder is located.</td>
</tr>
<tr>
<td>&lt;Local folder&gt;</td>
<td>User-defined updates source. Folder on the protected server.</td>
</tr>
<tr>
<td>/AK</td>
<td>Kaspersky Security Center Administration server as the updates source.</td>
</tr>
<tr>
<td>/KL</td>
<td>Kaspersky Lab's update servers as the updates sources.</td>
</tr>
<tr>
<td>/NOUSEKL</td>
<td>Do not use Kaspersky Lab's update servers if other updates sources are not available (used by default).</td>
</tr>
</tbody>
</table>

**Proxy server settings**

<table>
<thead>
<tr>
<th>Key</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>/PROXY:&lt;address&gt;:&lt;port&gt;</td>
<td>Network name or IP address of the proxy server and its port. If this key is not specified, Kaspersky Security for Windows Server will automatically detect the settings of the proxy server used in the local area network.</td>
</tr>
</tbody>
</table>
|  /AUTHTYPE:&lt;0-2&gt; | This key specifies the authentication method to access proxy server. It can have the following values:  
0 – in-built Microsoft Windows NTLM-authentication; Kaspersky Security for Windows Server will contact the proxy server under the *Local system* (*SYSTEM*) account  
1 – in-built Microsoft Windows NTLM-authentication; Kaspersky Security for Windows Server will contact the proxy server under account with login name and password specified by the keys /PROXYUSER and /PROXYPWD  
2 – authentication by login name and password specified by keys /PROXYUSER and /PROXYPWD (basic authentication)  
If authentication is not required for accessing the proxy server, there is no requirement to specify a key. |
<p>|  /PROXYUSER:&lt;username&gt; | User name which will be used for accessing proxy server. If the value of key /AUTHTYPE:0 is specified, then /PROXYUSER:&lt;username&gt; and /PROXYPWD:&lt;password&gt; keys will be ignored. |
|  /PROXYPWD:&lt;password&gt; | User password which will be used for accessing proxy server. If the value of key /AUTHTYPE:0 is specified, then /PROXYUSER:&lt;username&gt; and /PROXYPWD:&lt;password&gt; keys will be ignored. If /PROXYUSER key is specified and /PROXYPWD omitted, the password will be considered blank. |
|  /NOPROXYFORKL | Do not use proxy server settings for connecting with Kaspersky Lab's update servers (used by default). |
|  /USEPROXYFORCU STOM | Use proxy server settings for connecting to user-defined updates sources (not used by default). |
|  /USEPROXYFORLOCAL | Use proxy server settings for connecting to local updates sources. If not specified, the value <em>Do not use proxy server for local addresses</em> will apply. |</p>
<table>
<thead>
<tr>
<th>Key</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>General FTP and HTTP server settings</strong></td>
<td></td>
</tr>
<tr>
<td>/NOFTPPASSIVE</td>
<td>If this key is specified, Kaspersky Security for Windows Server will use the active FTP server mode to connect to the protected server. If this key is not specified, Kaspersky Security for Windows Server will use the passive FTP server mode, if possible.</td>
</tr>
<tr>
<td>/TIMEOUT:&lt;number of seconds&gt;</td>
<td>FTP or HTTP server connection timeout. If you do not specify this key, Kaspersky Security for Windows Server will use the default value: 10 sec. The key value must be a whole number.</td>
</tr>
<tr>
<td>/REG:&lt;iso3166 code&gt;</td>
<td>Regional settings. This key is used when receiving updates from Kaspersky Lab's update servers. Kaspersky Security for Windows Server optimizes the update load on the protected server by selecting the update server nearest to it. As the value of this key, specify the letter code of the location country for the protected server in accordance with ISO 3166-1, for example /REG: gr or /REG:RU. If this key is omitted or a non-existent country code is specified, Kaspersky Security for Windows Server will detect the location of the protected server based on the regional settings on the computer where the Application Console is installed.</td>
</tr>
<tr>
<td>/ALIAS:&lt;task alias&gt;</td>
<td>This key will allow you to assign a temporary name to the task, to be used to access the task during its execution. For example, task statistics can be viewed using the TASK command. The task alias must be unique among the task aliases of all functional components of Kaspersky Security for Windows Server. If this key is not specified, temporary name update_&lt;kavshell_pid&gt; is used; for example, update_1234. In the Application Console, the task is assigned the name Update-databases (&lt;date time&gt;); for example, Update-databases 8/16/2007 5:41:02 PM.</td>
</tr>
</tbody>
</table>
| /W:<path to task log file> | If this key is specified, Kaspersky Security for Windows Server will save the task log file with the name defined by the key's value. The log file contains task execution statistics, the time when it was started and completed (stopped), and information about events in this task. The log is used to register events defined by the settings of task logs and the Kaspersky Security for Windows Server event log in the “Event Viewer”.
Either the absolute or relative path to the log file can be specified. If only the file name is specified without its path, then the log file will be created in the current folder. Restarting the command with the same log settings will overwrite the existing log file. The log file can be viewed while a task is running. The log appears in the **Task logs** node of the Application Console. If Kaspersky Security for Windows Server fails to create the log file, it does not stop the command from executing or display an error message. |

Return codes for KAVSHELL UPDATE command (on page 568).
Rolling back Kaspersky Security for Windows Server database updates. KAVSHELL ROLLBACK

The KAVSHELL ROLLBACK command can be used to perform a Kaspersky Security for Windows Server database rollback system task (roll back Kaspersky Security for Windows Server databases to the previously installed version). The command is performed synchronously.

Command syntax:
KAVSHELL ROLLBACK

Return codes for the KAVSHELL ROLLBACK command (on page 568).

Managing log inspection. KAVSHELL TASK LOG-INSPECTOR

The KAVSHELL TASK LOG-INSPECTOR command can be used to monitor the environment integrity based on the Windows Event Log analysis.

Command syntax
KAVSHELL TASK LOG-INSPECTOR

Command examples
KAVSHELL TASK LOG-INSPECTOR /stop

<table>
<thead>
<tr>
<th>Key</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>/START</td>
<td>Starts the specified task in asynchronous mode.</td>
</tr>
<tr>
<td>/STOP</td>
<td>Stops the specified task.</td>
</tr>
<tr>
<td>/STATE</td>
<td>Returns the current task status (for example, Running, Completed, Paused, Stopped, Failed, Starting, Recovering).</td>
</tr>
<tr>
<td>/STATISTICS</td>
<td>Retrieve task statistics - information on the number of objects processed from the time the task started until now.</td>
</tr>
</tbody>
</table>

Return codes for the KAVSHELL TASK LOG-INSPECTOR command (see Section "Return codes for KAVSHELL TASK LOG-INSPECTOR command" on page 566).

Activating application KAVSHELL LICENSE

Kaspersky Security for Windows Server keys and activation codes can be managed using the KAVSHELL LICENSE command.

Password might be required to execute the command. To enter the current password use [/pwd:<password>] key.
KAVSHELL LICENSE command syntax
KAVSHELL LICENSE [/ADD:<key file | activation code> [/R] | /DEL:<key | activation code number>]

KAVSHELL LICENSE command examples
► To activate the application, execute the command:
KAVSHELL.EXE LICENSE / ADD: <activation code or key>

► To view information on added keys, execute the command:
KAVSHELL LICENSE

► To remove an added key with number 0000-000000-00000001, execute the command:
KAVSHELL LICENSE /DEL:0000-000000-00000001

The KAVSHELL LICENSE command can run with keys or without them (see table below).

<table>
<thead>
<tr>
<th>Key</th>
<th>Description</th>
</tr>
</thead>
</table>
| Without keys | The command returns the following information about added keys:  
  - Key.  
  - License type (commercial).  
  - Duration of the license associated with the key.  
  - Key status (active or additional). If the value specified is *, the key has been added as an additional key. |
| /ADD:<key file name or activation code> | Adds key via the specified file or activation code.  
  System environment variables can be used when specifying the path to a key file;  
  user environment variables are not allowed. |
| /R | The /R activation code or key is an addition to the /ADD activation code or key and indicates that the activation code or key being added is an additional activation code or key. |
| /DEL:<key or activation code> | Deletes the key with the specified number or the selected activation code. |

Return codes for KAVSHELL LICENSE command (see Section "Return codes for the KAVSHELL LICENSE command" on page 569).

Enabling, configuring and disabling trace log. KAVSHELL TRACE

The KAVSHELL TRACE command can be used to enable and disable the trace log for all Kaspersky Security for Windows Server subsystems and to set the log detail level.

Kaspersky Security for Windows Server writes information to trace files and the dump file in unencrypted form.
KAVSHELL TRACE command syntax

KAVSHELL TRACE */ON */F:<path to trace log file folder> */S:<maximum log size in megabytes> */LVL:debug|info|warning|error|critical | */OFF>

If the trace log is maintained and you wish to change its settings, enter KAVSHELL TRACE command with */ON key and specify trace log settings with values of */S and */LVL keys (see table below).

Table 100. KAVSHELL TRACE command keys

<table>
<thead>
<tr>
<th>Key</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>*/ON</td>
<td>Enables the trace log.</td>
</tr>
<tr>
<td>*/F:&lt;folder with trace log files&gt;</td>
<td>This key specifies the full path to the folder to which the trace log files will be saved (required). If a path to a non-existent folder is specified, no trace log will be created. Paths to folders on the network drives of other unprotected servers cannot be specified. If a space character is contained in the name of the folder to which you specify the path as the value of the key, put the path to this folder into quotes, for example: */F:&quot;C:\Trace Folder&quot;. System environment variables can be used when specifying the path to the trace log files; user environment variables are not allowed.</td>
</tr>
<tr>
<td>*/S: &lt;maximum log file size in megabytes&gt;</td>
<td>This key sets the maximum size of a single trace log file. As soon as the log file reaches the maximum level, Kaspersky Security for Windows Server will start recording information into a new file; the previous log file will be saved. If the value of this key is not specified, the maximum size of one log file will be 50 MB.</td>
</tr>
<tr>
<td>*/LVL:debug</td>
<td>info</td>
</tr>
<tr>
<td>*/OFF</td>
<td>This key disables the trace log.</td>
</tr>
</tbody>
</table>

KAVSHELL TRACE command examples

- To enable the trace log using the All debug information level of detail and maximum log size of 200MB, and to save the log file to folder C:\Trace Folder, execute the command:

  KAVSHELL TRACE /ON /F:C:\Trace Folder" /S:200

- To enable the trace log using the Important events level of detail, and to save the log file to folder C:\Trace Folder, execute the command:

  KAVSHELL Trace /ON /F:C:\Trace Folder" /LVL:warning
To disable the trace log, execute the command:

```
KAVSHELL TRACE /OFF
```

Return codes for KAVSHELL TRACE command (see Section "Return codes for the KAVSHELL TRACE command" on page 569).

**Kaspersky Security for Windows Server log files defragmentation. KAVSHELL VACUUM**

Using the **KAVSHELL VACUUM** command you can defragment the application log files. It allows to avoid system and the application errors due to the storage of large number of log files generated based on the application events.

Password might be required to execute the command. To enter the current password use `[/pwd:<password>]` key.

It is recommended to apply the **KAVSHELL VACUUM** command to optimize log files storage in case of frequent On-Demand Scan scans and update tasks starts. While executing the command, Kaspersky Security for Windows Server renews a logical structure for the application log files that are stored on a protected server by specified path.

By default, the application log files are stored at `C:\ProgramData\Kaspersky Lab\Kaspersky Security for Windows Server\10.1\Reports`. If you have manually specified another path for storing logs, the **KAVSHELL VACUUM** command executes defragmentation for files in folder that is specified in the Kaspersky Security for Windows Server logs settings.

Big size of files defragmenting increases the **KAVSHELL VACUUM** command execution period.

The Real-Time Protection and the Server Control tasks are not available to perform during the **KAVSHELL VACUUM** command execution. On-going defragmentation process restricts access to Kaspersky Security for Windows Server log and rejects events logging. To avoid security level decrease, it is recommended to plan the **KAVSHELL VACUUM** command execution at the downtime in advance.

To defragment the Kaspersky Security for Windows Server log files, execute the following command:

```
KAVSHELL VACUUM
```

Command execution is possible if started with local administrator account rights.
Cleaning iSwift base. KAVSHELL FBRESET

Kaspersky Security for Windows Server uses the iSwift technology, which allows the application to avoid rescanning files that have not been modified since the last scan (Use iSwift technology).

Kaspersky Security for Windows Server creates in the %SYSTEMDRIVE%\System Volume Information folder files klamfb.dat and klamfb2.dat, which contains information about clean objects that have already been scanned. The file klamfb.dat (klamfb2.dat) grows with the number of files scanned by Kaspersky Security for Windows Server. The file only contains current information about files existing in the system: if a file is removed, Kaspersky Security for Windows Server purges information about it from klamfb.dat.

To clean up a file, use the command KAVSHELL FBRESET.

Please keep in mind the following specifics for operating the KAVSHELL FBRESET command:

- While cleaning the file klamfb.dat by means of the KAVSHELL FBRESET command, Kaspersky Security for Windows Server does not pause the protection (unlike in cases of manual deletion of klamfb.dat).
- Kaspersky Security for Windows Server may increase the server workload after the data is cleared in klamfb.dat. In this case, Kaspersky Security for Windows Server scans all files accessed for the first time after the clearing of klamfb.dat. After the scan, Kaspersky Security for Windows Server adds back to klamfb.dat the information about each scanned object. In the case of new attempts to access the object, the iSwift technology will prevent rescanning of the file provided it remains unchanged.

The KAVSHELL FBRESET command execution is available only if the command line is started under the SYSTEM account.

Enabling and disabling dump file creation. KAVSHELL DUMP

Creation of snapshots (dump file) for Kaspersky Security for Windows Server processes in cases of abnormal termination can be enabled or disabled using the KAVSHELL DUMP command (see the following table). Additionally memory snapshots of Kaspersky Security for Windows Server processes in progress can be taken at any time.

For the dump file to be successfully created the KAVSHELL DUMP command must be executed under the local system account (SYSTEM).

KAVSHELL DUMP command syntax

KAVSHELL DUMP </ON /F:<folder with the dump file>|/SNAPSHOT /F:< folder with the dump file> / P:<pid> | /OFF>
### Table 101. KAVSHELL DUMP command keys

<table>
<thead>
<tr>
<th>Key</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>/ON</td>
<td>Enables creation of the process memory dump file in cases of abnormal termination.</td>
</tr>
<tr>
<td>/F:&lt;path to folder with dump files&gt;</td>
<td>This is a mandatory key. It specifies the path to the folder to which the dump file will be saved. Paths to folders on the network drives of other unprotected servers cannot be specified. System environment variables can be used when specifying the path to the folder with the memory dump file; user environment variables are not allowed.</td>
</tr>
<tr>
<td>/SNAPSHOT</td>
<td>Takes a snapshot of the memory of the process in progress with a specified PID and saves the dump file into the folder the path to which is specified by key /F.</td>
</tr>
<tr>
<td>/P</td>
<td>PID process identifier is displayed in the Microsoft Windows Task Manager.</td>
</tr>
<tr>
<td>/OFF</td>
<td>Disables the creation of the memory dump file in cases of abnormal termination.</td>
</tr>
</tbody>
</table>

Return codes for KAVSHELL DUMP command (see Section "Return codes for the KAVSHELL DUMP command" on page 570).

### KAVSHELL DUMP command examples

- To enable creation of the dump file; to save the dump file to folder C:\Dump Folder, execute the command:

  KAVSHELL DUMP /ON /F:"C:\Dump Folder"

- To make a dump for the process with ID 1234 to folder C:/Dumps, execute the command:

  KAVSHELL DUMP /SNAPSHOT /F:C:\dumps /F:1234

- To disable generation of the dump file, execute the command:

  KAVSHELL DUMP /OFF

### Importing settings. KAVSHELL IMPORT

The KAVSHELL IMPORT command allows you to import the settings of Kaspersky Security for Windows Server, its features and tasks from a configuration file to a copy of Kaspersky Security for Windows Server on the protected server. A configuration file can be created using the KAVSHELL EXPORT command.

Password might be required to execute the command. To enter the current password use 
[/pwd:<password>] key.
KAVSHELL IMPORT command syntax

KAVSHELL IMPORT <name of configuration file and path to file>

KAVSHELL IMPORT command examples

KAVSHELL IMPORT Host1.xml

<table>
<thead>
<tr>
<th>Key</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;name of configuration file and path to file&gt;</td>
<td>Name of configuration file used as the import source for settings. System environment variables can be used when specifying the path to the file; user environment variables are not allowed.</td>
</tr>
</tbody>
</table>

Return codes for KAVSHELL IMPORT command (see Section "Return codes for the KAVSHELL IMPORT command" on page 571).

Exporting settings. KAVSHELL EXPORT

The KAVSHELL EXPORT command allows you to export all of the settings of Kaspersky Security for Windows Server and its current tasks to a configuration file in order to import them later into copies of Kaspersky Security for Windows Server installed on other server.

KAVSHELL EXPORT command syntax

KAVSHELL EXPORT <name of configuration file and path to file>

KAVSHELL EXPORT command examples

KAVSHELL EXPORT Host1.xml

<table>
<thead>
<tr>
<th>Key</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;name of configuration file and path to file&gt;</td>
<td>Name of configuration file which will contain settings. Any extension can be assigned to the configuration file. System environment variables can be used when specifying the path to the file; user environment variables are not allowed.</td>
</tr>
</tbody>
</table>

Return codes for KAVSHELL EXPORT command (see Section "Return codes for the KAVSHELL EXPORT command" on page 571).

Integration with Microsoft Operations Management Suite. KAVSHELL OMSINFO

Using the KAVSHELL OMSINFO command you can review status of the application and information about threats detected by anti-virus databases and KSN service. The data about threats is taken from the available event logs.

KAVSHELL OMSINFO command syntax

KAVSHELL OMSINFO <full path to generated file with file name>
**KAVSHELL OMSINFO command examples**

KAVSHELL OMSINFO C:\Users\Admin\Desktop\omsinfo.json

<table>
<thead>
<tr>
<th>Key</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;path to generated file with file name&gt;</td>
<td>Name of the generated file which will contain information about application status and detected threats.</td>
</tr>
</tbody>
</table>

Contacting Technical Support

This section describes the ways to receive technical support and the conditions on which it is available.

In this chapter

How to get technical support ................................................................. 572
Get technical support by phone ............................................................ 572
Technical Support via Kaspersky CompanyAccount .................................. 573
Using trace files and AVZ scripts .......................................................... 573

How to get technical support

If you cannot find a solution to your problem in the application documentation or in one of the sources of information about the application, we recommend that you contact Technical Support. Technical Support specialists will answer your questions about installing and using the application.

Technical support is available only to users who have purchased a commercial license for the application. Technical support is not available to users who have a trial license.

Before contacting Technical Support, please read through the Technical Support rules.

You can contact Technical Support in one of the following ways:

- By calling Technical Support.
- By sending a request to Kaspersky Lab Technical Support through the Kaspersky CompanyAccount portal (https://companyaccount.kaspersky.com).

Get technical support by phone

You can call Technical Support specialists from most regions worldwide. You can find information about how to obtain technical support in your region and contact information for Technical Support on the Kaspersky Lab Technical Support website (https://support.kaspersky.com/b2b).

Before contacting Technical Support, please read the support rules (https://support.kaspersky.com/support/rules#en_us).
Technical Support via Kaspersky CompanyAccount

Kaspersky CompanyAccount ([https://companyaccount.kaspersky.com](https://companyaccount.kaspersky.com)) is a portal for companies that use Kaspersky Lab applications. Kaspersky CompanyAccount is designed to facilitate interaction between users and Kaspersky Lab specialists via online requests. Kaspersky CompanyAccount lets you monitor the progress of electronic request processing by Kaspersky Lab specialists and store a history of electronic requests.

You can register all of your organization's employees under a single user account on Kaspersky CompanyAccount. A single account lets you centrally manage electronic requests from registered employees to Kaspersky Lab and also manage the privileges of these employees via Kaspersky CompanyAccount.

Kaspersky CompanyAccount is available in the following languages:

- English
- Spanish
- Italian
- German
- Polish
- Portuguese
- Russian
- French
- Japanese

To learn more about Kaspersky CompanyAccount, visit the Technical Support website [http://support.kaspersky.com/faq/companyaccount_help](http://support.kaspersky.com/faq/companyaccount_help).

Using trace files and AVZ scripts

After you report a problem to Kaspersky Lab Technical Support specialists, they may ask you to generate a report with information about the operation of Kaspersky Security for Windows Server and to send it to Kaspersky Lab Technical Support. Kaspersky Lab Technical Support specialists may also ask you to create a trace file. The trace file allows following the process of how application commands are performed, step by step, in order to determine the stage of application operation at which an error occurs.

After analyzing the data you send, Kaspersky Lab Technical Support specialists can create an AVZ script and send it to you. With AVZ scripts, it is possible to analyze active processes for threats, scan the computer for threats, disinfect or delete infected files, and create system scan reports.

For more effective support and troubleshooting of application problems, Technical Support specialists may ask you to change application settings temporarily for purposes of debugging during diagnostics. This may require doing the following:

- Activating the functionality that processes and stores extended diagnostic information.
- Fine-tuning the settings of individual software components, which are not available via standard user interface elements.
- Changing the settings of storage and transmission of diagnostic information that was processed.
- Configuring the interception and logging of network traffic.
Glossary

A

Active key
A key that is currently used by the application.

Administration Server
A component of Kaspersky Security Center that centrally stores information about all Kaspersky Lab applications that are installed within the corporate network. It can also be used to manage these applications.

Anti-virus databases
Databases that contain information about computer security threats known to Kaspersky Lab as of when the anti-virus databases are released. Entries in anti-virus databases allow malicious code to be detected in scanned objects. Anti-virus databases are created by Kaspersky Lab specialists and updated hourly.

Archive
One or more file(s) packaged into a single file through compression. A dedicated application, called an archiver, is required for packing and unpacking the data.

B

Backup
A special storage for backup copies of files, which are created before disinfection or deletion is attempted.

D

Disinfection
A method of processing infected objects that results in full or partial recovery of data. Not all infected objects can be disinfected.

E

Event severity
Property of an event encountered during the operation of a Kaspersky Lab application. There are four severity levels:

- Critical event.
- Error.
- Warning.
- Info.
Events of the same type can have different severity levels depending on the situation in which the event occurred.

**F**

False positive

A situation when a Kaspersky Lab application considers a non-infected object to be infected because the object's code is similar to that of a virus.

**File mask**

Representation of a file name using wildcards. The standard wildcards used in file masks are * and ?, where * represents any number of any characters and ? stands for any single character.

**H**

Heuristic analyzer

A technology for detecting threats about which information has not yet been added to Kaspersky Lab databases. The heuristic analyzer detects objects whose behavior in the operating system may pose a security threat. Objects detected by the heuristic analyzer are considered to be probably infected. For example, an object may be considered probably infected if it contains sequences of commands that are typical of malicious objects (open file, write to file).

**I**

Infectable file

A file that, due to its structure or format, can be used by criminals as a "container" to store and spread malicious code. As a rule, these are executable files, with such file extensions as .com, .exe, and .dll. The risk of penetration of malicious code into such files is quite high.

Infected object

An object of which a portion of code completely matches part of the code of known malware. Kaspersky Lab does not recommend accessing such objects.

**K**

Kaspersky Security Network (KSN)

An infrastructure of cloud services that provides access to the Kaspersky Lab database with constantly updated information about the reputation of files, web resources, and software. Kaspersky Security Network ensures faster responses by Kaspersky Lab applications to threats, improves the performance of some protection components, and reduces the likelihood of false positives.
License term

A time period during which you have access to the application features and rights to use additional services. The services you can use depend on the type of the license.

Local task

A task defined and running on a single client computer.

OLE object

An object attached to another file or embedded into another file through the use of the Object Linking and Embedding (OLE) technology. An example of an OLE object is a Microsoft Office Excel® spreadsheet embedded into a Microsoft Office Word document.

Policy

A policy determines an application’s settings and manages the ability to configure that application on computers within an administration group. An individual policy must be created for each application. You can create an unlimited number of different policies for applications installed on computers in each administration group, but only one policy can be applied at a time to each application within an administration group.

Protection status

Current protection status, which reflects the level of computer security.

Quarantine

The folder to which the Kaspersky Lab application moves probably infected objects that have been detected. Objects are stored in Quarantine in encrypted form in order to avoid any impact on the computer.

Real-time protection

The application's operating mode under which objects are scanned for the presence of malicious code in real time. The application intercepts all attempts to open any object (read, write, or execute) and scans the object for threats. Uninfected objects are passed on to the user; objects containing threats or probably infected objects are processed according to the task settings (disinfected, deleted or quarantined).
S

Security level
The security level is defined as a pre-configured set of application component settings.

SIEM
A technology that analyzes security events originating from various network devices and applications.

Startup objects
A set of applications needed for the operating system and software that is installed on the computer to start and operate correctly. These objects are executed every time the operating system is started. There are viruses capable of infecting such objects specifically, which may lead, for example, to blocking of operating system startup.

T

Task
Functions performed by the Kaspersky Lab application are implemented as tasks, such as: Real-time file protection, Full computer scan, and Database update.

Task settings
Application settings that are specific for each task type.

U

Update
The procedure of replacing / adding new files (databases or application modules) retrieved from the Kaspersky Lab update servers.

V

Vulnerability
A flaw in an operating system or an application that may be exploited by malware makers to penetrate the operating system or application and corrupt its integrity. Presence of a large number of vulnerabilities in an operating system makes it unreliable, because viruses that penetrate the operating system may cause disruptions in the operating system itself and in installed applications.
AO Kaspersky Lab

Kaspersky Lab is a world-renowned vendor of systems protecting computers against digital threats, including viruses and other malware, unsolicited email (spam), and network and hacking attacks.

In 2008, Kaspersky Lab was rated among the world’s top four leading vendors of information security software solutions for end users (IDC Worldwide Endpoint Security Revenue by Vendor). Kaspersky Lab is the preferred vendor of computer protection systems for home users in Russia (IDC Endpoint Tracker 2014).

Kaspersky Lab was founded in Russia in 1997. It has since grown into an international group of companies with 38 offices in 33 countries. The company employs more than 3,000 skilled professionals.

**Products.** Kaspersky Lab products provide protection for all systems, from home computers to large corporate networks.

The personal product range includes security applications for desktop, laptop, and tablet computers, smartphones and other mobile devices.

The company offers protection and control solutions and technologies for workstations and mobile devices, virtual machines, file and web servers, mail gateways, and firewalls. The company’s portfolio also features specialized products providing protection against DDoS attacks, protection for industrial control systems, and prevention of financial fraud. Used in conjunction with centralized management tools, these solutions ensure effective automated protection for companies and organizations of any size against computer threats. Kaspersky Lab products are certified by major test laboratories, compatible with software from diverse vendors, and optimized to run on many hardware platforms.

Kaspersky Lab virus analysts work around the clock. Every day they uncover hundreds of thousands of new computer threats, create tools to detect and disinfect them, and include their signatures in databases used by Kaspersky Lab applications.

**Technologies.** Many technologies that are now part and parcel of modern anti-virus tools were originally developed by Kaspersky Lab. It is no coincidence that many other developers use the Kaspersky Anti-Virus engine in their products, including: Alcatel-Lucent, Alt-N, Asus, BAE Systems, Blue Coat, Check Point, Cisco Meraki, Clearswift, D-Link, Facebook, General Dynamics, H3C, Juniper Networks, Lenovo, Microsoft, NETGEAR, Openwave Messaging, Parallels, Qualcomm, Samsung, Stormshield, Toshiba, Trustwave, Vertu, and ZyXEL. Many of the company’s innovative technologies are patented.

**Achievements.** Over the years, Kaspersky Lab has won hundreds of awards for its services in combating computer threats. Following tests and research conducted by the reputed Austrian test laboratory AV-Comparatives in 2014, Kaspersky Lab ranked among the top two vendors by the number of Advanced+ certificates earned and was ultimately awarded the Top Rated certificate. But Kaspersky Lab’s main achievement is the loyalty of its users worldwide. The company’s products and technologies protect more than 400 million users, and its corporate clients number more than 270,000.
